ScheduledRecording:2 Service

For UPnP Version 1.0
Status: Standardized DCP (SDCP)
Date: March 31, 2013
Service Template Version 1.01

This Standardized DCP has been adopted as a Standardized DCP by the Steering Committee of the UPnP Forum, pursuant to Section 2.1(c)(ii) of the UPnP Forum Membership Agreement. UPnP Forum Members have rights and licenses defined by Section 3 of the UPnP Forum Membership Agreement to use and reproduce the Standardized DCP in UPnP Compliant Devices. All such use is subject to all of the provisions of the UPnP Forum Membership Agreement.

THE UPnP FORUM TAKES NO POSITION AS TO WHETHER ANY INTELLECTUAL PROPERTY RIGHTS EXIST IN THE STANDARDIZED DCPs. THE STANDARDIZED DCPs ARE PROVIDED "AS IS" AND "WITH ALL FAULTS". THE UPNP FORUM MAKES NO WARRANTIES, EXPRESS, IMPLIED, STATUTORY, OR OTHERWISE WITH RESPECT TO THE STANDARDIZED DCPs, INCLUDING BUT NOT LIMITED TO ALL IMPLIED WARRANTIES OF MERCHANTABILITY, NONINFRINGEMENT AND FITNESS FOR A PARTICULAR PURPOSE, OF REASONABLE CARE OR WORKMANLIKE EFFORT, OR RESULTS OR OF LACK OF NEGLIGENCE.

1 Overview and Scope

This service definition is compliant with the UPnP Device Architecture version 1.0. It defines a service type referred to herein as ScheduledRecording service.

1.1 Introduction

The ScheduledRecording service is a UPnP service that allows control points to schedule the recording of content. Generally, this content is broadcast content, but this specification does not limit itself to broadcast content. This service type enables the following functions:

- Create a recordSchedule so that it is added to the list of recordSchedule instances. Each recordSchedule describes user-level recording instructions for the ScheduledRecording service.
- Browse a list of recordSchedule instances stored by the ScheduledRecording service.
- Delete a recordSchedule so that it is removed from the list of recordSchedule instances.
- Browse a list of recordTask instances, stored by the ScheduledRecording service. The ScheduledRecording service may create zero or more recordTask instances for each recordSchedule. A recordTask represents a discrete recording operation of a recordSchedule.
- Enable or disable individual recordTask instances.
- Enable or disable a recordSchedule.
- Receive notifications indicating change of recordSchedule or recordTask list.

The ScheduledRecording service does not require a dependency on any UPnP services other than a co-located ContentDirectory service, which provides the following functions:

- A ContentDirectory service provides channel line-up to allow users to find recordable channels. A control point may use this metadata when creating a recordSchedule on a ScheduledRecording service.
- A ContentDirectory service may provide Electronic Program Guide (EPG) features to allow users to find recordable content. A control point may use this metadata when creating a recordSchedule on a ScheduledRecording service.
- Contents recorded by the ScheduledRecording service may be exposed by a ContentDirectory service.

The architectural relationship among the different concepts, defined by the ScheduledRecording service can be summarized as follows: A ScheduledRecording service owns a flat (that is: non-nested) list of recordSchedule instances, meaning that the ScheduledRecording service may create, destroy, or change recordSchedule instances. A recordSchedule represents user-level instructions to perform recording operations. Generally, a user constructs his instructions to a ScheduledRecording service via a control point that invokes UPnP actions that affect the list of recordSchedule instances. In all cases, the ScheduledRecording service MUST be able to describe discrete recording operations for a recordSchedule through a list of associated recordTask instances. A recordTask can only exist with a recordSchedule (that is: never orphaned). Thus when a recordTask is created by the ScheduledRecording service, its lifetime depends on its parent recordSchedule. An individual recordTask can be selectively enabled or disabled.

This service template does not address:

- Implementations where the ScheduledRecording service and its associated ContentDirectory service are not co-located in the same device.
1.2 Notation

- In this document, features are described as Required, Recommended, or Optional as follows:
  The keywords “MUST,” “MUST NOT,” “REQUIRED,” “SHALL,” “SHALL NOT,” “SHOULD,” “SHOULD NOT,” “RECOMMENDED,” “MAY,” and “OPTIONAL” in this specification are to be interpreted as described in [RFC 2119].

In addition, the following keywords are used in this specification:
- PROHIBITED – The definition or behavior is prohibited by this specification. Opposite of REQUIRED.
- CONDITIONALLY REQUIRED – The definition or behavior depends on a condition. If the specified condition is met, then the definition or behavior is REQUIRED, otherwise it is PROHIBITED.
- CONDITIONALLY OPTIONAL – The definition or behavior depends on a condition. If the specified condition is met, then the definition or behavior is OPTIONAL, otherwise it is PROHIBITED.

These keywords are thus capitalized when used to unambiguously specify requirements over protocol and application features and behavior that affect the interoperability and security of implementations. When these words are not capitalized, they are meant in their natural-language sense.

- Strings that are to be taken literally are enclosed in “double quotes”.
- Words that are emphasized are printed in italic.
- Keywords that are defined by the UPnP AV Working Committee are printed using the forum character style.
- Keywords that are defined by the UPnP Device Architecture specification are printed using the arch character style [DEVICE].
- A double colon delimiter, “::”, signifies a hierarchical parent-child (parent::child) relationship between the two objects separated by the double colon. This delimiter is used in multiple contexts, for example: Service::Action(), Action()::Argument, parentProperty::childProperty.

1.2.1 Data Types

This specification uses data type definitions from two different sources. The UPnP Device Architecture defined data types are used to define state variable and action argument data types [DEVICE]. The XML Schema namespace is used to define property data types [XML SCHEMA-2].

For UPnP Device Architecture defined boolean data types, it is strongly RECOMMENDED to use the value “0” for false, and the value “1” for true. However, when used as input arguments, the values “false”, “no”, “true”, “yes” may also be encountered and MUST be accepted. Nevertheless, it is strongly RECOMMENDED that all boolean state variables and output arguments be represented as “0” and “1”.

For XML Schema defined Boolean data types, it is strongly RECOMMENDED to use the value “0” for false, and the value “1” for true. However, when used as input properties, the values “false”, “true” may also be encountered and MUST be accepted. Nevertheless, it is strongly RECOMMENDED that all Boolean properties be represented as “0” and “1”.

1.2.2 Strings Embedded in Other Strings

Some string variables and arguments described in this document contain substrings that MUST be independently identifiable and extractable for other processing. This requires the definition of appropriate
substring delimiters and an escaping mechanism so that these delimiters can also appear as ordinary characters in the string and/or its independent substrings. This document uses embedded strings in two contexts – Comma Separated Value (CSV) lists (see Section 1.3.1, “Comma Separated Value (CSV) Lists”) and property values in search criteria strings. Escaping conventions use the backslash character, “\” (character code U+005C), as follows:

a. Backslash (“\”) is represented as “\” in both contexts.
b. Comma (“,”) is
   1. represented as “,“ in individual substring entries in CSV lists
   2. not escaped in search strings
c. Double quote (“"”) is
   1. not escaped in CSV lists
   2. not escaped in search strings when it appears as the start or end delimiter of a property value
   3. represented as “\” in search strings when it appears as a character that is part of the property value

1.2.3 Extended Backus-Naur Form

Extended Backus-Naur Form is used in this document for a formal syntax description of certain constructs. The usage here is according to the reference [EBNF].

1.2.3.1 Typographic conventions for EBNF

Non-terminal symbols are unquoted sequences of characters from the set of English upper and lower case letters, the digits “0” through “9”, and the hyphen (“-“). Character sequences between 'single quotes' are terminal strings and MUST appear literally in valid strings. Character sequences between (*comment delimiters*) are English language definitions or supplementary explanations of their associated symbols. White space in the EBNF is used to separate elements of the EBNF, not to represent white space in valid strings. White space usage in valid strings is described explicitly in the EBNF.

Finally, the EBNF uses the following operators:

<table>
<thead>
<tr>
<th>Operator</th>
<th>Semantics</th>
</tr>
</thead>
<tbody>
<tr>
<td>::=</td>
<td>definition – the non-terminal symbol on the left is defined by one or more alternative sequences of terminals and/or non-terminals to its right.</td>
</tr>
<tr>
<td></td>
<td>alternative separator – separates sequences on the right that are independently allowed definitions for the non-terminal on the left.</td>
</tr>
<tr>
<td>*</td>
<td>null repetition – means the expression to its left MAY occur zero or more times.</td>
</tr>
<tr>
<td>+</td>
<td>non-null repetition – means the expression to its left MUST occur at least once and MAY occur more times.</td>
</tr>
<tr>
<td>[ ]</td>
<td>optional – the expression between the brackets is optional.</td>
</tr>
<tr>
<td>( )</td>
<td>grouping – groups the expressions between the parentheses.</td>
</tr>
<tr>
<td>-</td>
<td>character range – represents all characters between the left and right character operands inclusively.</td>
</tr>
</tbody>
</table>
1.3 Derived Data Types

This section defines a derived data type that is represented as a string data type with special syntax. This specification uses string data type definitions that originate from two different sources. The UPnP Device Architecture defined **string** data type is used to define state variable and action argument **string** data types. The XML Schema namespace is used to define property xsd:string data types. The following definition applies to both string data types.

1.3.1 Comma Separated Value (CSV) Lists

The UPnP AV services use state variables, action arguments and properties that represent lists – or one-dimensional arrays – of values. The UPnP Device Architecture, Version 1.0 [DEVICE], does not provide for either an array type or a list type, so a list type is defined here. Lists MAY either be homogeneous (all values are the same type) or heterogeneous (values of different types are allowed). Lists MAY also consist of repeated occurrences of homogeneous or heterogeneous subsequences, all of which have the same syntax and semantics (same number of values, same value types and in the same order). The data type of a homogeneous list is **string** or xsd:string and denoted by CSV (\(x\)), where \(x\) is the type of the individual values. The data type of a heterogeneous list is also **string** or xsd:string and denoted by CSV (\(x, y, z\)), where \(x\), \(y\) and \(z\) are the types of the individual values. If the number of values in the heterogeneous list is too large to show each type individually, that variable type is represented as CSV (heterogeneous), and the variable description includes additional information as to the expected sequence of values appearing in the list and their corresponding types. The data type of a repeated subsequence list is **string** or xsd:string and denoted by CSV (\( \{a,b,c\}, \{x, y, z\} \)), where \(a\), \(b\), \(c\), \(x\), \(y\) and \(z\) are the types of the individual values in the subsequence and the subsequences MAY be repeated zero or more times.

- A list is represented as a **string** type (for state variables and action arguments) or xsd:string type (for properties).
- Commas separate values within a list.
- Integer values are represented in CSVs with the same syntax as the integer data type specified in [DEVICE] (that is: optional leading sign, optional leading zeroes, numeric US-ASCII)
- Boolean values are represented in state variable and action argument CSVs as either “0” for false or “1” for true. These values are a subset of the defined **boolean** data type values specified in [DEVICE]: 0, false, no, 1, true, yes.
- Boolean values are represented in property CSVs as either “0” for false or “1” for true. These values are a subset of the defined Boolean data type values specified in [XML SCHEMA-2]: 0, false, 1, true.
- Escaping conventions for the comma and backslash characters are defined in Section 1.2.2, “Strings Embedded in Other Strings”.
- White space before, after, or interior to any numeric data type is not allowed.
- White space before, after, or interior to any other data type is part of the value.

<tr>
<td>CSV (<strong>boolean</strong>) or CSV (xsd:Boolean)</td>
<td>“0,1,1,0”</td>
<td>List of 4 booleans.</td>
</tr>
</tbody>
</table>
1.4 Management of XML Namespaces in Standardized DCPs

UPnP specifications make extensive use of XML namespaces. This allows separate DCPs, and even separate components of an individual DCP, to be designed independently and still avoid name collisions when they share XML documents. Every name in an XML document belongs to exactly one namespace. In documents, XML names appear in one of two forms: qualified or unqualified. An unqualified name (or no-colon-name) contains no colon ("\") characters. An unqualified name belongs to the document’s default namespace. A qualified name is two no-colon-names separated by one colon character. The no-colon-name before the colon is the qualified name’s namespace prefix, the no-colon-name after the colon is the qualified name’s “local” name (meaning local to the namespace identified by the namespace prefix). Similarly, the unqualified name is a local name in the default namespace.

The formal name of a namespace is a URI. The namespace prefix used in an XML document is not the name of the namespace. The namespace name is, or should be, globally unique. It has a single definition that is accessible to anyone who uses the namespace. It has the same meaning anywhere that it is used, both inside and outside XML documents. The namespace prefix, however, in formal XML usage, is defined only in an XML document. It must be locally unique to the document. Any valid XML no-colon-name may be used. And, in formal XML usage, no two XML documents are ever required to use the same namespace prefix to refer to the same namespace. The creation and use of the namespace prefix was standardized by the W3C XML Committee in [XML-NMSP] strictly as a convenient local shorthand replacement for the full URI name of a namespace in individual documents.

All AV object properties are represented in XML by element and attribute names, therefore, all property names belong to an XML namespace.
For the same reason that namespace prefixes are convenient in XML documents, it is convenient in specification text to refer to namespaces using a namespace prefix. Therefore, this specification declares a “standard” prefix for all XML namespaces used herein. In addition, this specification expands the scope where these prefixes have meaning, beyond a single XML document, to all of its text, XML examples, and certain string-valued properties. This expansion of scope does not supersede XML rules for usage in documents; it only augments and complements them in important contexts that are out-of-scope for the XML specifications. For example, action arguments which refer to CDS properties, such as the SearchCriteria argument of the Search() action or the Filter argument of the Browse() action, MUST use the predefined namespace prefixes when referring to CDS properties (“upnp:”, “dc:”, etc).

All of the namespaces used in this specification are listed in the Tables “Namespace Definitions” and “Schema-related Information”. For each such namespace, Table 1-3, “Namespace Definitions” gives a brief description of it, its name (a URI) and its defined “standard” prefix name. Some namespaces included in these tables are not directly used or referenced in this document. They are included for completeness to accommodate those situations where this specification is used in conjunction with other UPnP specifications to construct a complete system of devices and services. For example, since the Scheduled Recording Service depends on and refers to the Content Directory Service, the predefined “srs:” namespace prefix is included. The individual specifications in such collections all use the same standard prefix. The standard prefixes are also used in Table 1-4, “Schema-related Information”, to cross-reference additional namespace information. This second table includes each namespace’s valid XML document root element(s) (if any), its schema file name, versioning information (to be discussed in more detail below), and a link to the entry in Section 1.6, “References” for its associated schema.

The normative definitions for these namespaces are the documents referenced in Table 1-3. The schemas are designed to support these definitions for both human understanding and as test tools. However, limitations of the XML Schema language itself make it difficult for the UPnP-defined schemas to accurately represent all details of the namespace definitions. As a result, the schemas will validate many XML documents that are not valid according to the specifications.

The Working Committee expects to continue refining these schemas after specification release to reduce the number of documents that are validated by the schemas while violating the specifications, but the schemas will still be informative, supporting documents. Some schemas might become normative in future versions of the specifications.

1.4.1 Namespace Prefix Requirements

There are many occurrences in this specification of string data types that contain XML names (property names). These XML names in strings will not be processed under namespace-aware conditions. Therefore, all occurrences in instance documents of XML names in strings MUST use the standard namespace prefixes as declared in Table 1-3. In order to properly process the XML documents described herein, control points and devices MUST use namespace-aware XML processors [XML-NMSP] for both reading and writing. As allowed by [XML-NMSP], the namespace prefixes used in an instance document are at the sole discretion of the document creator. Therefore, the declared prefix for a namespace in a document MAY be different from the standard prefix. All devices MUST be able to correctly process any valid XML instance document, even when it uses a non-standard prefix for ordinary XML names. However, it is strongly RECOMMENDED that all devices use these standard prefixes for all instance documents to
avoid confusion on the part of both human and machine readers. These standard prefixes are used in all descriptive text and all XML examples in this and related UPnP specifications. Also, each individual specification may assume a default namespace for its descriptive text. In that case, names from that namespace may appear with no prefix.

The assumed default namespace, if any, for each UPnP AV specification is given in Table 1-5, “Default Namespaces for the AV Specifications”.

Note: all UPnP AV schemas declare attributes to be “unqualified”, so namespace prefixes are never used with AV Working Committee defined attribute names.

### 1.4.2 Namespace Names, Namespace Versioning and Schema Versioning

The UPnP AV service specifications define several data structures (such as state variables and action arguments) whose format is an XML instance document that must comply with one or more specific XML namespaces. Each namespace is uniquely identified by an assigned namespace name. The namespaces that are defined by the AV Working Committee MUST be named by a URN. See Table 1-3, “Namespace Definitions” for a current list of namespace names. Additionally, each namespace corresponds to an XML schema document that provides a machine-readable representation of the associated namespace to enable automated validation of the XML (state variable or action parameter) instance documents.

Within an XML schema and XML instance document, the name of each corresponding namespace appears as the value of an `xmlns` attribute within the root element. Each `xmlns` attribute also includes a namespace prefix that is associated with that namespace in order to disambiguate (a.k.a. qualify) element and attribute names that are defined within different namespaces. The schemas that correspond to the listed namespaces are identified by URI values that are listed in the `schemaLocation` attribute also within the root element. (See Section 1.4.3, “Namespace Usage Examples”)

In order to enable both forward and backward compatibility, namespace names are permanently assigned and MUST NOT change even when a new version of a specification changes the definition of a namespace. However, all changes to a namespace definition MUST be backward-compatible. In other words, the updated definition of a namespace MUST NOT invalidate any XML documents that comply with an earlier definition of that same namespace. This means, for example, that a namespace MUST NOT be changed so that a new element or attribute is required. Although namespace names MUST NOT change, namespaces still have version numbers that reflect a specific set of definitional changes. Each time the definition of a namespace is changed, the namespace’s version number is incremented by one.

Whenever a new namespace version is created, a new XML schema document (.xsd) is created and published so that the new namespace definition is represented in a machine-readable form. Since a XML schema document is just a representation of a namespace definition, translation errors can occur. Therefore, it is sometime necessary to re-release a published schema in order to correct typos or other
namespace representation errors. In order to easily identify the potential multiplicity of schema releases for the same namespace, the URI of each released schema MUST conform to the following format (called Form 1):

```
Form 1: "http://www.upnp.org/schemas/av/" schema-root-name "-v" ver "-" yyyymmdd
```

where
- **schema-root-name** is the name of the root element of the namespace that this schema represents.
- **ver** corresponds to the version number of the namespace that is represented by the schema.
- **yyyymmdd** is the year, month and day (in the Gregorian calendar) that this schema was released.

Table 1-4, “Schema-related Information” identifies the URI formats for each of the namespaces that are currently defined by the UPnP AV Working Committee.

As an example, the original schema URI for the “rcs-event” namespace (that was released with the original publication of the UPnP AV service specifications in the year 2002) was “http://www.upnp.org/schemas/av/rcs-event-v1-20020625.xsd”. When the UPnP AV service specifications were subsequently updated in the year 2006, the URI for the updated version of the “rcs-event” namespace was “http://www.upnp.org/schemas/av/rcs-event-v2-20060531.xsd”. However, in 2006, the schema URI for the newly created “srs-event” namespace was “http://www.upnp.org/schemas/av/srs-event-v1-20060531.xsd”. Note the version field for the “srs-event” schema is “v1” since it was first version of that namespace whereas the version field for the “rcs-event” schema is “v2” since it was the second version of that namespace.

In addition to the dated schema URIs that are associated with each namespace, each namespace also has a set of undated schema URIs. These undated schema URIs have two distinct formats with slightly different meanings:

```
Form 2: “http://www.upnp.org/schemas/av/” schema-root-name “-v” ver
```

where **ver** is described above.

```
Form 3: “http://www.upnp.org/schemas/av/” schema-root-name
```

Form 2 of the undated schema URI is always linked to the most recent release of the schema that represents the version of the namespace indicated by **ver**. For example, the undated URI “.../av/rcs-event-v2.xsd” is linked to the most recent schema release of version 2 of the “rcs-event” namespace. Therefore, on May 31, 2006 (20060531), the undated schema URI was linked to the schema that is otherwise known as “…/av/rcs-event-v2-20060531.xsd”. Furthermore, if the schema for version 2 of the “rcs-event” namespace was ever re-released, for example to fix a typo in the 20060531 schema, then the same undated schema URI (".../av/rcs-event-v2.xsd") would automatically be updated to link to the updated version 2 schema for the “rcs-event” namespace.

Form 3 of the undated schema URI is always linked to the most recent release of the schema that represents the highest version of the namespace that has been published. For example, on June 25, 2002 (20020625), the undated schema URI “.../av/rcs-event.xsd” was linked to the schema that is otherwise known as “…/av/rcs-event-v1-20020625.xsd”. However, on May 31, 2006 (20060531), that same undated schema URI was linked to the schema that is otherwise known as “…/av/rcs-event-v2-20060531.xsd”.

When referencing a schema URI within an XML instance document or a referencing XML schema document, the following usage rules apply:

- All instance documents, whether generated by a service or a control point, MUST use Form 3.
- All UPnP AV published schemas that reference other UPnP AV schemas MUST also use Form 3.

Within an XML instance document, the definition for the schemaLocation attribute comes from the XML Schema namespace “http://www.w3.org/2002/XMLSchema-instance”. A single occurrence of the attribute can declare the location of one or more schemas. The schemaLocation attribute value
1.4.3 Namespace Usage Examples

The schemaLocation attribute for XML instance documents comes from the XML Schema instance namespace “http://www.w3.org/2002/XMLSchema-instance”. A single occurrence of the attribute can declare the location of one or more schemas. The schemaLocation attribute value consists of a whitespace separated list of values: namespace name followed by its schema location URL. This pair-sequence is repeated as necessary for the schemas that need to be located for this instance document.

Example 1:

Sample DIDL-Lite XML Instance Document. Note that the references to the UPnP AV schemas do not contain any version or release date information. In other words, the references follow Form 3 from above. Consequently, this example is valid for all releases of the UPnP AV service specifications.

 </item>
</DIDL-Lite>
```

1.5 Vendor-defined Extensions

Whenever vendors create additional vendor-defined state variables, actions or properties, their assigned names and XML representation MUST follow the naming conventions and XML rules as specified below.

1.5.1 Vendor-defined Action Names

Vendor-defined action names MUST begin with “X_”. Additionally, it SHOULD be followed by an ICANN assigned domain name owned by the vendor followed by the underscore character (“_”). It MUST then be followed by the vendor-assigned action name. The vendor-assigned action name MUST NOT contain a hyphen character (“-“), 2D Hex in UTF-8 nor a hash character (“#”), 23 Hex in UTF-8). Vendor-assigned action names are case sensitive. The first character of the name MUST be a US-ASCII letter (“A”-“Z”, “a”-“z”), US-ASCII digit (“0”-“9”), an underscore (“_”) or a non-experimental Unicode letter or digit greater than U+007F. Succeeding characters MUST be a US-ASCII letter (“A”-“Z”, “a”-“z”), US-
ASCII digit ("0"-"9"), an underscore ("_"), a period ("."), a Unicode combining char, an extender, or a non-experimental Unicode letter or digit greater than U+007F. The first three letters MUST NOT be “XML” in any combination of case.

### 1.5.2 Vendor-defined State Variable Names

Vendor-defined state variable names MUST begin with “X_”. Additionally, it SHOULD be followed by an ICANN assigned domain name owned by the vendor, followed by the underscore character (“_”). It MUST then be followed by the vendor-assigned state variable name. The vendor-assigned state variable name MUST NOT contain a hyphen character (“-“), 2D Hex in UTF-8. Vendor-assigned action names are case sensitive. The first character of the name MUST be a US-ASCII letter (“A”-“Z,” “a”-“z”), US-ASCII digit (“0”-“9”), an underscore (“_”), or a non-experimental Unicode letter or digit greater than U+007F. Succeeding characters MUST be a US-ASCII letter (“A”-“Z,” “a”-“z”), US-ASCII digit (“0”-“9”), an underscore (“_”), a period (".") , a Unicode combining char, an extender, or a non-experimental Unicode letter or digit greater than U+007F. The first three letters MUST NOT be “XML” in any combination of case.

### 1.5.3 Vendor-defined XML Elements and attributes

UPnP vendors MAY add non-standard elements and attributes to a UPnP standard XML document, such as a device or service description. Each addition MUST be scoped by a vendor-owned XML namespace. Arbitrary XML MUST be enclosed in an element that begins with “X_“ and this element MUST be a sub element of a standard complex type. Non-standard attributes MAY be added to standard elements provided these attributes are scoped by a vendor-owned XML namespace and begin with “X_“.

### 1.5.4 Vendor-defined Property Names

UPnP vendors MAY add non-standard properties to the ContentDirectory service. Each property addition MUST be scoped by a vendor-owned namespace. The vendor-assigned property name MUST NOT contain a hyphen character (“-“), 2D Hex in UTF-8. Vendor-assigned property names are case sensitive. The first character of the name MUST be a US-ASCII letter (“A”-“Z,” “a”-“z”), US-ASCII digit (“0”-“9”), an underscore (“_“), or a non-experimental Unicode letter or digit greater than U+007F. Succeeding characters MUST be a US-ASCII letter (“A”-“Z,” “a”-“z”), US-ASCII digit (“0”-“9”), an underscore (“_“), a period (".") , a Unicode combining char, an extender, or a non-experimental Unicode letter or digit greater than U+007F. The first three letters MUST NOT be “XML” in any combination of case.

### 1.6 References

This section lists the normative references used in the UPnP AV specifications and includes the tag inside square brackets that is used for each such reference:

2 Service Modeling Definitions

2.1 ServiceType
The following service type identifies a service that is compliant with this template:

```
urn:schemas-upnp-org:service:ScheduledRecording:2
```

ScheduledRecording service is used herein to refer to this service type.

2.2 Terms and Abbreviations

2.2.1 Abbreviations

Table 2-1: Abbreviations

<table>
<thead>
<tr>
<th>Definition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CDS</td>
<td>ContentDirectory Service</td>
</tr>
<tr>
<td>EPG</td>
<td>Electronic Program Guide</td>
</tr>
<tr>
<td>SRS</td>
<td>ScheduledRecording Service</td>
</tr>
</tbody>
</table>

2.2.2 Terms

2.2.2.1 CDS object
An object in a ContentDirectory service metadata hierarchy; that is: `item` or `container`.

2.2.2.2 User Channel
A User Channel is a ContentDirectory service object that exposes the (continuous) content stream of a particular broadcast channel. Usually, the actual channel that the User Channel exposes is determined by the user through some device-specific interaction. Examples are: manual programming of a number of channel presets; invoking of the auto-scan functionality of a device; predefined fixed channel assignments by the device manufacturer.

2.2.2.3 Channel Group
A Channel Group is a ContentDirectory service `container` that holds a number of User Channel items. Typically, a Channel Group contains User Channel items that are bound to a particular hardware resource. Examples include: a single analog cable TV tuner, a HDTV digital tuner, an AM/FM radio tuner, etc.

2.2.2.4 Channel Line-up
A service provider-generated list of channels with their associated content provider.

2.2.2.5 object
A `recordSchedule` or a `recordTask` (see definition of `recordSchedule` and `recordTask` below).
2.2.2.6 class
As defined in the ContentDirectory service specification, a class is used to assign a type to an object. It also identifies the minimum REQUIRED set of properties that MUST be present on that object and the OPTIONAL properties that MAY be present. Classes are organized in a hierarchy with certain classes being derived from others as in a typical object-oriented system. This specification defines two base classes (recordSchedule and recordTask) from which all other classes are derived.

2.2.2.7 object Modification
An object is considered modified when one of its properties (or its list of properties) is modified; that is: added, removed or changed in value (see definition of property below).

2.2.2.8 recordSchedule
A ScheduledRecording service construct that represents a complete set of recording instructions to the service, which allows the service to generate recordTask objects as necessary to record the desired content. The creator of the recordSchedule object assigns it a specific class, based on the type and complexity of the instructions, used to identify the content.

A recordSchedule is represented in XML as an <item>…</item> element.

2.2.2.9 Conflicting recordSchedule
A conflicting recordSchedule exists when one or more of its associated recordTask instances is in conflict with another recordTask instance.

2.2.2.10 recordTask
A ScheduledRecording service construct that represents a discrete recording operation of the underlying recording system. A recordTask is created by its parent recordSchedule and can not be directly created by the user. The parent-child relationship of recordSchedule and recordTask can be 1-to-zero or more.

A recordTask is represented in XML as an <item>…</item> element.

2.2.2.11 Conflicting recordTask
A conflicting recordTask exists when it overlaps in time with one or more other recordTask instances and the ScheduledRecording service has insufficient resources to record all of them. Existing pre-roll and post-roll adjustments (as defined by the scheduledStartDateTimeAdjust and scheduledDurationAdjust properties) MUST be taken into account when determining conflicts.

2.2.2.12 recordScheduleParts
A ScheduledRecording service construct that represents user-level recording instructions to the service, which provide a template to generate complete recordSchedule objects. The creator of the recordScheduleParts object assigns it a specific class, based on the type and complexity of the instructions, used to identify the content.

A recordScheduleParts is represented in XML as an <item>…</item> element.

2.2.2.13 Property-set Data Types
Certain ScheduledRecording service actions use property-set arguments that contain information about a set of properties, typically expressed in the form of an srs XML Document (for example, the Elements argument of the CreateRecordSchedule() action). The set of properties that can exist in a property-set
argument is implementation dependent. Indeed, the set of optional properties that a particular ScheduledRecording service chooses to implement is vendor dependent.

This specification currently defines three different property-set data types:

- `A_ARG_TYPE_RecordSchedule`
- `A_ARG_TYPE_RecordTask`
- `A_ARG_TYPE_RecordScheduleParts`

Although these three types are different, they are very similar in nature and are defined using the same SRS schema [SRS-XSD], which defines all the properties that can ever occur in any of the three property-set data types. They differ only in the set of properties that can appear in them and in the values that are allowed for these properties.

2.2.2.14 Property

A property in the ScheduledRecording service represents a characteristic of an object. Properties are distinguished by their names. The ScheduledRecording service defines two kinds of properties – independent and dependent. Each independent property has zero or more dependent properties associated with it. Independent property names contain no “@” symbol; they may contain an XML namespace prefix (see below for an explanation of the relationship between properties and XML). Each dependent property is associated either with exactly one independent property or directly with a ScheduledRecording service class. The name of a dependent property that is associated with an independent property is the concatenation of three parts: its associated independent property name, the “@” symbol, and a name for the relationship between the two properties’ values. The name of a dependent property that is associated directly with a class is just the “@” symbol followed by the relationship name. Their data types and meanings are defined in Appendix B, “AV Working Committee Extended Properties”.

Even though ScheduledRecording service properties are not XML objects, XML is used to express them in all exchanges between a control point and a ScheduledRecording service implementation. This creates an unavoidable relationship between XML syntax and property names and values. In XML, an independent property is represented as an element. The property name is used as the element name. The property value is the element content. A dependent property is represented as an attribute in XML. The dependent property’s relationship name is used as the attribute name. The dependent property’s value is the attribute value. For dependent properties that are associated with an independent property, the attribute appears in the start tag of the element that represents its associated independent property. For dependent properties that are associated directly with a class, the attribute appears in the top-level start tag for each object of that class.

**Examples:**

**Table 2-1: Properties in XML**

<table>
<thead>
<tr>
<th>Property Name</th>
<th>XML Representation (srs declared as default namespace)</th>
</tr>
</thead>
<tbody>
<tr>
<td>title</td>
<td><code>&lt;title&gt;...&lt;/title&gt;</code></td>
</tr>
<tr>
<td>taskProgramCode</td>
<td><code>&lt;taskProgramCode&gt;...&lt;/taskProgramCode&gt;</code></td>
</tr>
<tr>
<td>taskProgramCode@type</td>
<td><code>&lt;taskProgramCode type=&quot;...&quot;&gt;...&lt;/taskProgramCode&gt;</code></td>
</tr>
<tr>
<td>@id</td>
<td><code>&lt;item id=&quot;...&quot;&gt;...&lt;/item&gt;</code></td>
</tr>
</tbody>
</table>

2.2.2.15 Member Property

A property is a member of a particular class when the property is declared to be either REQUIRED or OPTIONAL for that class.
2.2.2.16 Supported Member Property
A supported member property is a member property that is supported by a particular ScheduledRecording service implementation, according to the information returned by the GetPropertyList() action.

2.2.2.17 Multi-valued property
Some independent properties are multi-valued. This means that the property MAY occur more than once in an object.

2.2.2.18 Single-valued property
Most independent properties are single-valued. This means that the property MUST occur at most once in an object. Some single-valued properties can contain a CSV list of values. A dependent property is always considered single-valued, because it can occur at most once with each occurrence of its associated independent property, even though the independent property may be multi-valued.

2.2.2.19 XML Document
A string that represents a valid XML 1.0 document according to a specific schema. Every occurrence of the phrase “XML Document” is preceded by the appropriate root element name, italicized, as listed in column 3, “Valid Root Element(s)” of Table 1-4, “Schema-related Information”.

For example, the phrase “hrs XML Document” refers to an XML document based on the SRS Schema as defined in [SRS-XSD]. Such a document comprises a single <hrs ...> root element, optionally preceded by the XML declaration: <?xml version="1.0" ...?>.

Therefore, the string containing the hrs XML Document will have one of the following two forms:

"<hrs ...>...</hrs>"

or

"<?xml ...?>
<hrs ...>...</hrs>"

2.2.2.20 XML Fragment
An XML Fragment is a sequence of XML elements that are valid direct or indirect child elements of the root element according to a specific schema. Every occurrence of the phrase “XML Fragment” is preceded by the appropriate root element name, italicized, as listed in column 3, “Valid Root Element(s)” of Table 1-4, “Schema-related Information”.

For example, the phrase “hrs XML Fragment” refers to a sequence of XML elements that are defined in the SRS Schema as defined in [SRS-XSD]:

"<item id="..." ...>...</item>"

or

"<recordDestination mediaType="..." preference="...">...
</recordDestination>"

or

"<title>...</title>
<class>...</class>
..."...
"...
..."..."
2.2.2.21 actualScheduledStartDateTime
The actual scheduled start date and time of a program item is defined as:

\[ \text{actualScheduledStartDateTime} = \text{scheduledStartDateTime} + \text{scheduledStartDateTimeAdjust} \]

where \text{scheduledStartDateTime} is the scheduled broadcast start date and time of the program item and \text{scheduledStartDateTimeAdjust} is a user-supplied adjustment to that date and time, for example for pre-roll purposes.

2.2.2.22 actualStartTime
The actual start date and time of a program item is defined as:

\[ \text{actualStartTime} = \text{actualScheduledStartDateTime} + \text{any device-specific record startup latency} \]

2.2.2.23 actualScheduledEndDateTime
The actual scheduled end time of a program item is defined as:

\[ \text{actualScheduledEndDateTime} = \text{scheduledStartDateTime} + \text{scheduledDuration} + \text{scheduledDurationAdjust} \]

where \text{scheduledStartDateTime} is the scheduled broadcast start date and time of the program item, \text{scheduledDuration} is the scheduled broadcast duration of the program item and \text{scheduledDurationAdjust} is a user-supplied adjustment to that duration, for example to select just a part of the program for recording.

2.2.2.24 actualEndTime
The actual end date and time of a program item is defined as:

\[ \text{actualEndTime} = \text{actualScheduledEndDateTime} + \text{any device-specific record teardown latency} \]

2.2.2.25 actualScheduledDuration
The actual scheduled duration of a program item is defined as:

\[ \text{actualScheduledDuration} = \text{actualScheduledEndDateTime} - \text{actualScheduledStartDateTime} \]

\[ = \text{scheduledDuration} + \text{scheduledDurationAdjust} - \text{scheduledStartDateTimeAdjust} \]

where \text{scheduledDuration} is the scheduled broadcast duration of the program item, \text{scheduledDurationAdjust} is a user-supplied adjustment to that duration, and \text{scheduledStartDateTimeAdjust} is a user-supplied adjustment to the scheduled start date and time.

2.2.2.26 Lexical Sort Order
Lexical sort order refers to string sorting – also called collation – based on language and regional conventions. It is not based on the binary codes of the characters in strings. Furthermore, lexical sorting is not based on character sets; a single character set may have multiple sort orders, again according to language and regional conventions. It is also possible to have lexical sorts that are further refined according to user preference. For a complete discussion of this topic see [UTS 10], and the related standards [UAX 15] and [UTS 35]. [UTS 10] defines the lexical sort algorithms. It uses a secondary algorithm defined in [UAX 15] and supporting data tables defined in [UTS 35]. These three references together – [UAX 15], [UTS 10] and [UTS 35] – should be sufficient to implement a robust lexical sort.
Simple example: one of the most familiar examples is case-insensitive sorting on the ASCII subset of Unicode. In a binary ASCII sort, all lower case letters sort after the upper case “Z” because “Z” has a character code of 0x5A, and all lower case character codes are greater than or equal to 0x61.

More complex example: the “ö” character in German sorts between “n” and “p” characters whereas in Swedish, it sorts after “z”.

### 2.2.2.27 Lexical Matching

Lexical matching compares two (sub)strings for equality under certain lexical sorting conditions. *It is important to note* that equality in lexical matching is often less restrictive than equality in lexical sorting. In other words, two strings that are equal under a lexical sort will always be a lexical match. However, two strings that are a lexical match might not be equal under a lexical sort for the same language and region. In some cases, an implementation’s lexical sort might consider all alphabetic characters with diacritical marks (accents, umlauts, circumflexes, etc.) to be distinct, yet the same implementation might ignore diacritical marks in lexical matching. For example, the strings “resumé”, “resume” and “résumé” might sort as “resume” < “resumé” < “résumé”, but when a lexical match using the string “resume”, might find all three strings “resumé”, “resume” and “résumé”. For implementation techniques, see [UTS 10] Section 8, “Searching and Matching”.

### 2.2.2.28 Simple Non-case-sensitive Sort Order

A simple non-case-sensitive sort order applies only to Roman alphabetic characters. All lower case ASCII alphabetic characters MUST sort the same as their upper case equivalent, except when compared directly with their upper case equivalent, in which case the upper case character SHOULD sort before its lower case equivalent. This means that of the following three ordering relations, #1 MUST be true, at least one of #2 and #3 MUST be true, and #2 SHOULD be true.

1. “A” ≤ “a” < “B” ≤ “b” < … < “Y” ≤ “y” < “Z” ≤ “z”
2. “A” < “a” < “B” < “b” < … < “Y” < “y” < “Z” < “z”
3. “A” = “a” < “B” = “b” < … < “Y” = “y” < “Z” = “z”

Additionally, the same upper and lower case relationships SHOULD hold for non-ASCII Roman alphabetic characters. That is, lower case alphabetic characters with diacritical marks SHOULD sort as their upper case equivalent, except when compared directly with their upper case equivalent, in which case the upper case character should sort before its lower case equivalent. The ordering relation between ASCII and non-ASCII alphabetic characters is left unspecified. Also, the ordering relation between non-ASCII alphabetic characters that are not upper or lower case equivalents of each other is left unspecified. This may be summarized in the following relations. In each, the letter “c” represents any non-ASCII Roman alphabetic character. #4 SHOULD be true for all “c”. #5 SHOULD be true for all “c”. If #5 is false for any “c”, it should be false for all “c” and #6 SHOULD be true for all “c”.

1. upper(c) ≤ lower(c)
2. upper(c) < lower(c)
3. upper(c) = lower(c)

### 2.2.2.29 Simple Non-case-sensitive Matching

In a simple non-case-sensitive match, relation #0 above MUST be true, and relation #0 above SHOULD be true.
2.2.2.30 Numeric Sort Order
A sort order in which values are compared numerically. If the type of an individual value is numeric, the numeric value is used. If the type of an individual value is string, the string is converted to a number and that numeric value is used.

2.2.2.31 Boolean Sort Order
Boolean values are sorted with “0” (false) being less than “1” (true).

2.2.2.32 Sequenced Sort
A sequenced sort is a sort applied to a set of values, each of which is composed of a sequence of subvalues. The sequence is often in a CSV list, but there are other kinds of sequences used for sorting in this specification. The sequenced sort starts by sorting based on the first subvalue in the sequence. If all values differ in the first subvalue, the sort is finished. Otherwise, each subset of equal subvalues is then sorted based on the next subvalue in the sequence. This process repeats iteratively until there are no more subsets of equal subvalues or the sequence is exhausted.

2.2.2.33 Sequenced Lexical Sort
A sequenced sort in which all subvalues are strings and the subvalues are compared lexically.

2.2.2.34 Sequenced Numeric Sort
A sequenced sort in which each subvalue is either a number or the number represented by a string.

2.2.2.35 Lexical Numeric Sort
A lexical numeric sort is one where one or more substrings are known to represent numbers. The strings are then sorted using a sequenced sort, where the sequence is composed of the sequence of non-numeric and numeric substrings from the larger string.

For example, assume a property has the form <letter>-<number>, where <number> ranges from 1 to 10. In a straight ascending lexical sort, the values “A-10”, “A-1”, “A-2” would sort as: “A-1”, “A-10”, “A-2”. “A-10” sorts before “A-2” because they are equal in the first two character positions, but in the third position, “1” < “2”. However, in a lexical numeric sort, each string is considered to be a sequence of a letter and number separated by a hyphen. These values then sort as “A-1”, “A-2”, “A-10” because all three are equal in the first subvalue, “A”, but the second subvalue sorts as 1, 2, 10 in numeric order.

2.2.2.36 type Relationship Sort
This is a sort defined exclusively for independent properties that have a dependent property relationship named “type”. These properties are sorted as a sequence of two subvalues: the first subvalue is the value of the property’s xxx@type dependent property; the second subvalue is the value of the independent property xxx itself. The xxx@type subvalues are sorted as specified for the dependent xxx@type property in its own section. The independent property subvalues are sorted according to the order specified in its section. Sorting of the independent property may vary with the value of the dependent property.

2.3 ScheduledRecording Service Architecture

2.3.1 recordSchedule
A ScheduledRecording service implementation has a single, flat list of recordSchedule instances. A recordSchedule represents the user-level recording instructions to the ScheduledRecording service. These
user-level instructions have various levels of complexity. For example, a simple instruction may state: “record channel 15 at 4PM on March 19, 2004,” while a more complex instruction may state: “record all episodes of the DIY Home Improvement Show on any channel that has the show for the next month.” The behavior of a recordSchedule is described by one or more properties, and these properties can be manipulated through several actions.

As shown in Figure 1, when a control point requests a new scheduled recording to the ScheduledRecording service via the CreateRecordSchedule() action, the control point sets a number of properties and passes them to the ScheduledRecording service to express user-desired instructions to the scheduled recording. Then, as a response to the CreateRecordSchedule() action, the ScheduledRecording service creates a recordSchedule, assigns a unique ID to the recordSchedule and returns the recordSchedule with the complete set of initial property settings. The ScheduledRecording service MUST add OPTIONAL properties to the recordSchedule when a control point did not specify them. Additionally, the ScheduledRecording service MAY add some informative properties.

If a control point specifies unsupported or unknown properties as input to the CreateRecordSchedule() action, the ScheduledRecording service MUST gracefully ignore these. A control point can always parse the generated recordSchedule returned in the Result argument of the CreateRecordSchedule action to verify whether certain properties were rejected by the ScheduledRecording service. If unsupported values are set for supported properties, the ScheduledRecording service MUST return an error and the recordSchedule MUST NOT be created.

![Figure 1: Creating a new recordSchedule](image-url)
Some properties are defined as optional in the ScheduledRecording service. Therefore, a control point needs to determine which properties a ScheduledRecording service implementation actually supports. Since support levels and allowed values for properties can be different for recordScheduleParts, recordSchedule or recordTask usage, a pair of actions (GetPropertyList() and GetAllowedValues()) are provided to retrieve the relevant information. Figure 2 illustrates the concept.

Figure 2: Capability check.

Figure 3 illustrates how recordSchedule instances can be browsed by the control point after they have been created, to retrieve the updated/current values of the properties.

Figure 3: Browse recordSchedule.

Figure 4 illustrates how a control point can delete a recordSchedule from the ScheduledRecording service.

Figure 4: Delete a recordSchedule

2.3.2 recordTask

A recordSchedule will generate one recordTask for each recording operation that matches the criteria of the recordSchedule. A recordTask also has properties indicating its behavior. A recordTask is different from a recordSchedule in that it always represents a single recording operation whereas a recordSchedule may actually represent multiple recording operations. For example, a ScheduledRecording service that interprets a recordSchedule to lead to three different recording operations could generate three different
recordTask instances over its lifetime. At a given time, a recordSchedule can have zero (no recording operations currently scheduled) or more recordTask instances associated with it. A ScheduledRecording service MUST report at least one recordTask when the underlying system is performing a recording operation for some recordSchedule.

When a recordSchedule is created, the ScheduledRecording service generates necessary recordTask instances associated with each scheduled recording occurrence. The ScheduledRecording service may also later add a new recordTask whenever a new scheduled recording occurrence arrives. Similarly, a ScheduledRecording service may delete recordTask instances when they are no longer needed. This MAY happen in a device dependent manner. For example, some ScheduledRecording service implementations delete a recordTask when the recording is finished while other ScheduledRecording service implementations keep maintaining finished recordTask instances. A recordTask can only be created by the ScheduledRecording service as a result of a trigger from a recordSchedule. A control point can never create a recordTask directly. Both a recordTask and a recordSchedule MAY be deleted by the ScheduledRecording service or a control point.

The lifetime of a recordTask is determined in a vendor dependent way. Some implementations maintain a recordTask even after it finishes its recording while others may delete the recordTask once the recording finishes. However, in any implementation, when a recordSchedule is deleted, the ScheduledRecording service MUST delete all of its associated recordTask instances.

2.4 State Variables

Like the ContentDirectory service, the ScheduledRecording service is primarily action-based. The service state variables exist primarily to support argument passing within service actions. Information is not exposed directly through explicit state variables. Instead, a client retrieves ScheduledRecording service information via the return arguments of the actions defined below. The majority of state variables defined below exist simply to provide data type information for the arguments of the various actions of this service.

Reader Note: For a first-time reader, it may be more helpful to read the action definitions before reading the state variable definitions.

2.4.1 State Variable Overview

</tbody>
</table>

¹ R = Required, O = Optional, CR = CONDITIONALLY REQUIRED, CO = CONDITIONALLY OPTIONAL, X = Non-standard, add -D when deprecated (e.g., R-D, O-D).

² See Section 2.4.9, “A_ARG_TYPE_ObjectIDList” for conditions under which implementation of this state variable is REQUIRED.

#### Table 2-3: allowedValueList for the **DataTypeID** argument

1 R = REQUIRED, O = OPTIONAL, X = Non-standard.

### 2.4.2 SortCapabilities

This REQUIRED state variable contains a CSV list of property names that the ScheduledRecording service can use to sort the information returned in the Result argument of various actions, such as BrowseRecordSchedules() and BrowseRecordTasks(). An empty string indicates that the device does not support any kind of sorting. A wildcard “srs:*” indicates that any supported property within the srs namespace can be used for sorting.

### 2.4.3 SortLevelCapability

This REQUIRED state variable contains an integer that indicates the maximum number of property names that can be specified in the SortCriteria argument at the same time.
2.4.4 **StateUpdateID**

This REQUIRED state variable is a ScheduledRecording service system-wide numeric value. Its initial value is 0.

- **StateUpdateID** MUST be incremented by 1 whenever any of the following occurs:
  - A `recordSchedule` or `recordTask` is created or deleted.
  - A `recordSchedule` or `recordTask` is modified, which means that one or more properties are added, deleted or had their value changed.
  - Any other change to the state of the ScheduledRecording service that could be observed by a control point. This includes any vendor- or other future-defined behavior.
  - When the value of **StateUpdateID** is equal to the `ui4` maximum value of 4294967295 ($2^{32}-1$), incrementing it causes it to roll over to the value 0.
  - The increment and the operation that caused it must occur atomically relative to all information visible to any control point – including both action out arguments and evented variable values.

For example, consider the case where a control point invokes `CreateRecordSchedule()` to create a new `recordSchedule` that also immediately spawns exactly one `recordTask`. Assume that **StateUpdateID** is 10 when the control point invokes the action and that for a short time period around this invocation, no other activity occurs that affects the value of **StateUpdateID**. During this time period, exactly one of the following MUST be true as seen by all external observations (including the returned values from this `CreateRecordSchedule()` invocation):

- **StateUpdateID** is 10; and the new `recordSchedule` has not been created; and the new `recordTask` has not been created.
- **StateUpdateID** is 11; and the `recordSchedule` has been created; and the new `recordTask` has not been created; and the `recordSchedule`’s value of `currentRecordTaskCount` is 0, indicating that no `recordTask` has been created.
- **StateUpdateID** is 12; and the `recordSchedule` has been created; and the new `recordTask` has been created; and the `recordSchedule`’s value of `currentRecordTaskCount` is 1, indicating that the child `recordTask` has been created.

ScheduledRecording service implementations SHOULD maintain the same value for **StateUpdateID** through power cycles and any other disappearance/reappearance of the service on the network. Control points can use a change in the value of this variable to determine if there has been a change in the ScheduledRecording service.

The value of the **StateUpdateID** state variable, returned within events and returned as an output argument of certain actions should be monitored very closely by control points. Indeed, whenever an action returns with a **StateUpdateID** value in its `UpdateID` argument that is less than the **StateUpdateID** value received in the `updateID` attribute from the most recent LastChange event, the information returned by that action is potentially stale. A control point may want to refresh that information for instance by invoking the appropriate `Browsexxx()` or `Getxxx()` action. It is safe to use the information as long as the **StateUpdateID** value returned in the `updateID` argument of the action is greater than or equal to the **StateUpdateID** value received in the `updateID` attribute from the most recent LastChange event.

2.4.5 **LastChange**

**Note:** It is assumed that the default namespace for this sub-section (2.4.5, “LastChange”) of the specification is srs-lc.

This REQUIRED state variable is used for eventing purposes to allow clients to receive meaningful event notifications whenever a `recordSchedule` or `recordTask` in the ScheduledRecording service changes.
[SRS-EVENT-XSD] defines the schema for the StateEvent XML Document used in this state variable. The optional XML header <?xml version="1.0"?> is allowed. One root element, <StateEvent> MAY have zero or more elements, each of which represent one update to a recordSchedule or recordTask instance. Six types of update elements are defined as shown in Table 2-4, “Allowed Elements in <StateEvent> Element”. Future ScheduledRecording service specifications MAY add other types of update elements. A vendor MAY add vendor-defined elements. The ScheduledRecording:1 service does not define the value for these elements. Vendor-defined element names MUST follow the rules set forth in Section 1.5, “Vendor-defined Extensions”. Note that future ScheduledRecording service specifications MAY define sub-elements for the elements. Also note that this state variable MUST be properly escaped as defined in [XML].

Table 2-4: Allowed Elements in <StateEvent> Element

<table>
<thead>
<tr>
<th>Element Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>RecordScheduleCreated</td>
<td>A new recordSchedule is created.</td>
</tr>
<tr>
<td>RecordScheduleModified</td>
<td>One or more properties of a recordSchedule are modified (added, deleted or values are changed).</td>
</tr>
<tr>
<td>RecordScheduleDeleted</td>
<td>A recordSchedule is deleted.</td>
</tr>
<tr>
<td>RecordTaskCreated</td>
<td>A new recordTask is created.</td>
</tr>
<tr>
<td>RecordTaskModified</td>
<td>One or more properties of a recordTask are modified (added, deleted or values are changed).</td>
</tr>
<tr>
<td>RecordTaskDeleted</td>
<td>A recordTask is deleted.</td>
</tr>
<tr>
<td>Vendor-defined</td>
<td>See Section 1.5, “Vendor-defined Extensions”.</td>
</tr>
</tbody>
</table>

Each element MUST have one updateID attribute, which is set to the value of the StateUpdateID state variable at the time of the update and one objectID attribute, whose value is set to the value of the @id property of the updated recordSchedule or recordTask instance. Future ScheduledRecording service specifications MAY add other attributes to existing update elements. A vendor MAY add vendor-defined attributes for existing update elements.

Example (before XML escaping)

```xml
<?xml version="1.0" encoding="UTF-8"?>
<StateEvent xmlns="urn:schemas-upnp-org:av:srs-event"
            xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
            xsi:schemaLocation="urn:schemas-upnp-org:av:srs-event
                                http://www.upnp.org/schemas/av/srs-event.xsd">
  <RecordScheduleCreated updateID="213" objectID="s001"/>
  <RecordTaskCreated updateID="214" objectID="s001-001"/>
  <RecordTaskModified updateID="215" objectID="s001-001"/>
</StateEvent>
```

The LastChange state variable is evented and moderated. When multiple updates occurred within a LastChange moderation period, the new LastChange state variable reports more than one update at the same time. A series of updates and the resulting eventing activity are illustrated in their temporal order in the following example.

Example

0: ScheduledRecording service activity = Power-on.

StateUpdateID = 0
**ScheduledRecording:**

*LastChange* (before XML escaping):

```xml
<?xml version="1.0" encoding="UTF-8"?>
<StateEvent
xmlns="urn:schemas-upnp-org:av:srs-event"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="urn:schemas-upnp-org:av:srs-event
http://www.upnp.org/schemas/av/srs-event.xsd">
</StateEvent>
```

GENA behavior: None

1: **ScheduledRecording service activity** = a *recordSchedule* with `@id = “s001”` is created.

*StateUpdateID* = 1

*LastChange* (before XML escaping):

```xml
<?xml version="1.0" encoding="UTF-8"?>
<StateEvent
xmlns="urn:schemas-upnp-org:av:srs-event"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="urn:schemas-upnp-org:av:srs-event
http://www.upnp.org/schemas/av/srs-event.xsd">
<RecordScheduleCreated updateID="1" objectID="s001">
</RecordScheduleCreated>
</StateEvent>
```

GENA behavior: Nothing is evented since there are no current subscribers.

2: **ScheduledRecording service activity** = new control point signs up for events.

*StateUpdateID* = 1

*LastChange* (before XML escaping):

```xml
<?xml version="1.0" encoding="UTF-8"?>
<StateEvent
xmlns="urn:schemas-upnp-org:av:srs-event"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="urn:schemas-upnp-org:av:srs-event
http://www.upnp.org/schemas/av/srs-event.xsd">
<RecordScheduleCreated updateID="1" objectID="s001">
</RecordScheduleCreated>
</StateEvent>
```

GENA behavior: Send initial Notify with the *LastChange* value above.

3: **ScheduledRecording service activity** = a *recordTask* with `@id = “t001-000”` is created. Its associated *recordSchedule* with `@id = “s001”` is modified by the ScheduledRecording service at the same time because its *currentRecordTaskCount* property is updated to reflect the existence of the new *recordTask*.

*StateUpdateID* = 3

*LastChange* (before XML escaping):

```xml
<?xml version="1.0" encoding="UTF-8"?>
<StateEvent
xmlns="urn:schemas-upnp-org:av:srs-event"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="urn:schemas-upnp-org:av:srs-event
http://www.upnp.org/schemas/av/srs-event.xsd">
</StateEvent>
```
<RecordTaskCreated updateID="2" objectID="t001-000"/>
</RecordTaskCreated>
<RecordScheduleModified updateID="3" objectID="s001"/>
</RecordScheduleModified>
</StateEvent>

GENA behavior: Wait for the next moderation period to elapse and then send Notify with the LastChange value above.

4: ScheduledRecording service activity = a recordTask with \@id = “t001-001” is created. Its associated recordSchedule with \@id = “s001” is modified by the ScheduledRecording service at the same time because its currentRecordTaskCount property is updated to reflect the existence of the new recordTask. Within the same moderation period, a recordTask with \@id = “t001-002” is also created. Its associated recordSchedule with \@id = “s001” is modified by the ScheduledRecording service at the same time because its currentRecordTaskCount property is updated to reflect the existence of the new recordTask.

StateUpdateID = 7
LastChange (before XML escaping):

<?xml version="1.0" encoding="UTF-8"?>
<StateEvent
xmlns="urn:schemas-upnp-org:av:srs-event"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="urn:schemas-upnp-org:av:srs-event http://www.upnp.org/schemas/av/srs-event.xsd">
<RecordTaskCreated updateID="4" objectID="t001-001"/>
</RecordTaskCreated>
<RecordScheduleModified updateID="5" objectID="s001"/>
</RecordScheduleModified>
<RecordTaskCreated updateID="6" objectID="t001-002"/>
</RecordTaskCreated>
<RecordScheduleModified updateID="7" objectID="s001"/>
</RecordScheduleModified>
</StateEvent>

GENA behavior: Wait for the next moderation period to elapse and then send Notify with the LastChange value above.

2.4.6 A_ARG_TYPE_PropertyList
This REQUIRED state variable is introduced to provide type information for various action arguments that contain a CSV list of property names. Namespace prefixes MUST be included with all property names (see Section 1.4, “Management of XML Namespaces”). The exact semantics of these property names depend on the associated action.

2.4.7 A_ARG_TYPE_DataTypeID
This REQUIRED state variable is introduced to provide type information for various action arguments that are used to identify a specific property-set data type (see Section 2.2.2.13, “Property-set Data Types”). An argument of type A_ARG_TYPE_DataTypeID can have the values listed in Table 2-3, “allowedValueList for the DataTypeID argument”.

© 2013, UPnP Forum. All rights Reserved.
2.4.8 **A_ARG_TYPE_ObjectID**

This REQUIRED state variable is introduced to provide type information for various action arguments that uniquely identify an individual `recordSchedule` or a `recordTask` by their object ID.

2.4.9 **A_ARG_TYPE_ObjectIDLList**

This CONDITIONALLY REQUIRED state variable MUST be supported if the `GetRecordScheduleConflicts()` or `GetRecordTaskConflicts()` actions are implemented. The state variable is introduced to provide type information for various action arguments that contain a CSV list of object IDs (@id) used to identify a collection of either `recordSchedule` or `recordTask` instances (the list MUST be homogeneous).

2.4.10 **A_ARG_TYPE_PropertyInfo**

This REQUIRED state variable is introduced to provide type information for various action arguments that contain detailed XML-based information on supported properties and their interdependencies for a particular ScheduledRecording service implementation. The format of these arguments is similar to the XML Service Description (SCPD), but instead of describing state variables and actions, they describe properties, their allowed values, and interdependencies.

Refer to [AVDT] for the definition of the AVDT Datastructure Template.

Note that since the format of these arguments is based on XML, it needs to be escaped (using the normal XML rules: [XML] Section 2.4 Character Data and Markup) before embedding in a SOAP response message.

2.4.11 **A_ARG_TYPE_Index**

This REQUIRED state variable is introduced to provide type information for various action arguments that specify an offset into an arbitrary set of objects. A value of 0 represents the first object in the set.

2.4.12 **A_ARG_TYPE_Count**

This REQUIRED state variable is introduced to provide type information for various action arguments that specify a number of arbitrary objects.

2.4.13 **A_ARG_TYPE_SortCriteria**

This REQUIRED state variable is introduced to provide type information for various action arguments that contain a CSV list of property names prefixed by one or more sort modifiers. Namespace prefixes MUST be included with all property names that do not belong to the srs namespace. Namespace prefixes MAY be included with property names that belong to the srs namespace (see Section 1.4, “Management of XML Namespaces”). The “+” and “-” sort modifier prefixes indicate that the sort is in ascending or descending order, respectively, with regard to the value of the prefixed property name.

2.4.14 **A_ARG_TYPE_RecordSchedule**

This REQUIRED state variable is introduced to provide type information for various action arguments that contain a list of zero or more `recordSchedule` objects. All instances of this data type MUST comply with the SRS schema. See Appendix A, “srs XML Document” for details.

The structure of an argument of data type `A_ARG_TYPE_RecordSchedule` is an `srs XML Document`:

- Optional XML declaration `<?xml version="1.0" ?>`
- `<srs>` is the root element.
• The $\text<srs>$ element MUST have zero or more $\text<item>$ elements, each representing a $\text{recordSchedule}$ object.

• Each $\text<item>$ element has a set of property values describing the $\text{recordSchedule}$ object. Each property is expressed either as the content of an XML element or as the value of an XML attribute.

• See [SRS-XSD] for more details on the structure. The ScheduledRecording service-defined names for metadata are described in Appendix B, “AV Working Committee Extended Properties.”

Note that since the SRS format of an argument of data type $\text{A_ARG_TYPE_RecordSchedule}$ is XML, it needs to be escaped (using the normal XML rules: [XML] Section 2.4 Character Data and Markup) before embedding in a SOAP response message.

2.4.15 $\text{A_ARG_TYPE_RecordTask}$

This REQUIRED state variable is introduced to provide type information for various action arguments that contain a list of zero or more $\text{recordTask}$ objects. All instances of this data type MUST comply with the SRS schema. See Appendix A, “$\text{srXML Document}$” for details.

The structure of an argument of data type $\text{A_ARG_TYPE_RecordTask}$ is an $\text{srXML Document}$:

• Optional XML declaration <xml version="1.0" ?>

• $\text<srs>$ is the root element.

• The $\text<srs>$ element MUST have zero or more $\text<item>$ elements, each representing a $\text{recordTask}$ object.

• Each $\text<item>$ element has a set of property values describing the $\text{recordTask}$ object. Each property is expressed either as the content of an XML element or as the value of an XML attribute.

• See [SRS-XSD] for more details on the structure. The ScheduledRecording service-defined names for metadata are described in Appendix B, “AV Working Committee Extended Properties.”

Note that since the SRS format of an argument of data type $\text{A_ARG_TYPE_RecordTask}$ is XML, it needs to be escaped (using the normal XML rules: [XML] Section 2.4 Character Data and Markup) before embedding in a SOAP response message.

2.4.16 $\text{A_ARG_TYPE_RecordScheduleParts}$

This REQUIRED state variable is introduced to provide type information for various action arguments that contain a single $\text{recordScheduleParts}$ object. A $\text{recordScheduleParts}$ object indicates the desired values for a subset of properties that provide a template for other $\text{recordSchedule}$ objects. Typically, a $\text{recordScheduleParts}$ is used to create new $\text{recordSchedule}$ objects. All instances of this data type MUST comply with the SRS schema. See Appendix A, “$\text{srXML Document}$” for details.

The structure of an argument of data type $\text{A_ARG_TYPE_RecordScheduleParts}$ is an $\text{srXML Document}$:

• Optional XML declaration <xml version="1.0" ?>

• $\text<srs>$ is the root element.

• The $\text<srs>$ element MUST have a single $\text<item>$ element, representing the $\text{recordScheduleParts}$ object.
• The `<item>` element has a set of property values describing the `recordScheduleParts` object. Each property is expressed either as the content of an XML element or as the value of an XML attribute.

• See [SRS-XSD] for more details on the structure. The ScheduledRecording service-defined names for metadata are described in Appendix B, “AV Working Committee Extended Properties.”

Note that since the SRS format of an argument of data type `A_ARG_TYPE_RecordScheduleParts` is XML, it needs to be escaped (using the normal XML rules: [XML] Section 2.4 Character Data and Markup) before embedding in a SOAP response message.

Non-standard actions implemented by a UPnP vendor go here

1 For a device this column indicates whether a control point MUST be capable of invoking this action, where R = REQUIRED, O = OPTIONAL, CR = CONDITIONALLY REQUIRED, CO = CONDITIONALLY OPTIONAL, X = Non-standard, add -D when deprecated (e.g., R-D, O-D).

2 For a control point this column indicates whether a control point MUST be capable of invoking this action, where R = REQUIRED, O = OPTIONAL, CR = CONDITIONALLY REQUIRED, CO = CONDITIONALLY OPTIONAL, X = Non-standard, add -D when deprecated (e.g., R-D, O-D).

3 REQUIRED only if the control point implements interaction with the ScheduledRecording service.

4 See action description for conditions under which implementation of this action is REQUIRED.

2.6.1 GetSortCapabilities()

This REQUIRED action returns a CSV list of property names that can be used in the SortCriteria argument of various actions.
2.6.1.1 Arguments

Table 2-7: Arguments for GetSortCapabilities()

<table>
<thead>
<tr>
<th>Argument</th>
<th>Direction</th>
<th>relatedStateVariable</th>
</tr>
</thead>
<tbody>
<tr>
<td>SortCaps</td>
<td>OUT</td>
<td>SortCapabilities</td>
</tr>
<tr>
<td>SortLevelCap</td>
<td>OUT</td>
<td>SortLevelCapability</td>
</tr>
</tbody>
</table>

2.6.1.1.1 SortCaps

This argument contains a CSV list of property names that the ScheduledRecording service can use to sort the information returned in the Result argument of various actions, such as BrowseRecordScheduled() and BrowseRecordTasks(). The appropriate namespace prefixes (either “sr:s” or “<vendor-defined namespace prefix>:”) MUST be included with the returned property names (see Section 1.4, “Management of XML Namespaces”). An empty string indicates that the device does not support any kind of sorting. A wildcard “sr:s:*” indicates that any property within the srs namespace can be used for sorting. See also Section 2.4.2, “SortCapabilities”.

2.6.1.1.2 SortLevelCap

This argument contains an integer that indicates the maximum number of property names that can be specified at the same time in the SortCriteria argument of various actions. See also Section 2.4.3, “SortLevelCapability.”

2.6.1.2 Dependency on State

None.

2.6.1.3 Effect on State

None.

2.6.1.4 Errors

Table 2-8: Error Codes for GetSortCapabilities()

<table>
<thead>
<tr>
<th>ErrorCode</th>
<th>errorDescription</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>400-499</td>
<td>TBD</td>

<td>See UPnP Device Architecture section on Control.</td>
</tr>
<tr>
<td>600-699</td>
<td>TBD</td>
<td>See UPnP Device Architecture section on Control.</td>
</tr>
</tbody>
</table>

2.6.2 GetPropertyList()

The REQUIRED GetPropertyList() action provides a means to retrieve from a particular ScheduledRecording service implementation which properties are actually supported for a specific property-set data type. The GetPropertyList() action returns a CSV list of property names that may appear in action arguments of the property-set data type, specified in the DataTypeID input argument. This CSV list MUST include property names of imported properties from other namespaces as well as any vendor-defined property names. For example, the ContentDirectory service imported properties (such as dc:title) that are included as part of the value of the cd:Reference property, MUST be returned.

© 2013, UPnP Forum. All rights Reserved.
The appropriate namespace prefixes MUST be included with all property names (see Section 1.4, “Management of XML Namespaces”).

The set of allowed values for srs properties and vendor-defined properties (when used for the specified property-set data type) can be obtained via the GetAllowedValues() action. The set of allowed values for imported properties cannot be retrieved by the GetAllowedValues() action.

2.6.2.1 Arguments

Table 2-9: Arguments for GetPropertyList()

<table>
<thead>
<tr>
<th>Argument</th>
<th>Direction</th>
<th>relatedStateVariable</th>
</tr>
</thead>
<tbody>
<tr>
<td>DataTypeID</td>
<td>IN</td>
<td>A_ARG_TYPE_DataTypeID</td>
</tr>
<tr>
<td>PropertyList</td>
<td>OUT</td>
<td>A_ARG_TYPE_PropertyList</td>
</tr>
</tbody>
</table>

2.6.2.1.1 DataTypeID

The DataTypeID argument identifies the property-set data type for which the set of property names is to be returned. See Section 2.4.7, “A_ARG_TYPE_DataTypeID” for details regarding its format. The set of allowed values is listed in Table 2-3, “allowedValueList for the DataTypeID argument”.

2.6.2.1.2 PropertyList

The PropertyList argument contains the set of property names (including their namespace prefixes) that may appear in action arguments of the property-set data type, specified by the DataTypeID input argument.

2.6.2.2 Dependency on State

None.

2.6.2.3 Effect on State

None.

2.6.2.4 Errors

Table 2-10: Error Codes for GetPropertyList()

<table>
<thead>
<tr>
<th>ErrorCode</th>
<th>errorDescription</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>400-499</td>

<td>TBD</td>
<td>See UPnP Device Architecture section on Control.</td>
</tr>
<tr>
<td>711</td>
<td>Invalid</td>
<td>An invalid value has been specified in the DataTypeID input argument.</td>
</tr>
</tbody>
</table>

2.6.3 GetAllowedValues()

This REQUIRED action is used to determine the allowed values and dependencies for srs properties that can appear within action arguments of the specified property-set data type. The set of allowed values that are returned is static and does not depend on the current state of the ScheduledRecording service. The
property information is returned in an AVDT XML Document as defined in [AVDT]. The set of properties for which information is returned is determined by the intersection of the property names in the Filter argument and the names of the properties supported by the implementation for the specified property-set data type in the DataTypeID argument. All property names MUST belong either to the srs namespace or a vendor-defined namespace.

The set of allowed values for imported properties cannot be retrieved by the GetAllowedValues() action.

### 2.6.3.1 Arguments

<td>OUT</td>
<td>A_ARG_TYPE_PropertyInfo</td>
</tr>
</tbody>
</table>

#### 2.6.3.1.1 **DataTypeID**

See Section 2.6.2.1.1, “DataTypeID”.

#### 2.6.3.1.2 **Filter**

The Filter argument contains a CSV list of property names that indicates for which properties allowed value information is to be returned in the AVDT XML Document, contained in the PropertyInfo output argument. The Filter argument SHOULD only include property names that are returned in the PropertyList argument of the GetPropertyList() action when specifying the same value in the DataTypeID argument. ScheduledRecording service implementations MUST gracefully ignore other property names. The “srs:” namespace prefix MUST be included with srs property names in the Filter argument. Likewise, a namespace prefix MUST be included with all vendor-defined property names in the Filter argument (see Section 1.4, “Management of XML Namespaces”).

If the Filter argument is set to “*::*”, then allowed values for all supported properties (including srs properties and vendor-defined properties, but excluding imported properties) for the specified property-set data type MUST be returned. If the Filter argument is set to “srs:*”, then allowed values for all supported properties in the srs namespace MUST be returned. If the Filter argument is set to “<vendor-defined namespace prefix>::*”, then allowed values for all vendor-defined properties in that namespace MUST be returned. If the Filter argument is set to the empty string, no information is provided (an AVDT XML Document with an empty root element is returned).

Examples of valid Filter argument values include:

- “srs:@id,srs:priority@orderedValue”
- “srs:title,srs:class”
- “*::*”
- “srs:*”

#### 2.6.3.1.3 **PropertyInfo**

The PropertyInfo argument MUST only include allowed value and dependency information on properties that are specified in the Filter argument. The PropertyInfo argument MUST be properly escaped as
2.6.3.2 Dependency on State
None.

2.6.3.3 Effect on State
None.

</tr>
</tbody>
</table>

2.6.4 GetStateUpdateID()

This REQUIRED action returns the current value of the StateUpdateID state variable in the Id output argument. This action can be used to poll the ScheduledRecording service for any change in the service that might have occurred since the last time this action was invoked. If the returned Id value is different from the value that was returned the last time this action was invoked, then there has been a change in one or more recordSchedule or recordTask objects in the ScheduledRecording service. See Section 2.4.4, “StateUpdateID” for more information.

</tbody>
</table>

2.6.5.1.1 Filter

The Filter argument contains a CSV list of property names that indicates which properties are to be returned in the srs XML Document, contained in the Result output argument. Namespace prefixes MUST be included with all property names, specified in the Filter argument (see Section 1.4, “Management of XML Namespaces”).

The Filter argument has no impact on the number of objects returned in the Result argument. Instead, the Filter argument allows control points to control the complexity of the object metadata that is returned in the srs XML Document for each object. It allows a control point to specify a subset of the supported properties for inclusion in the srs XML Document. Properties that are REQUIRED by the SRS Schema MUST always be returned. Compliant ScheduledRecording service implementations MUST NOT return optional properties unless they are explicitly requested in the Filter input argument or are needed to create a valid XML document. For example, specifying a dependent property in the Filter argument, such as priority@orderedValue, will cause its associated independent property, priority, to be included in the srs XML Document.

In all cases, a compliant ScheduledRecording service implementation MUST always respond to query requests with the smallest, valid srs XML Document in the Result argument that satisfies the Filter input argument. If the Filter argument is set to the empty string (“”), then only the REQUIRED properties are returned.
If the `Filter` argument is equal to "*:*", then all supported properties for all supported namespaces MUST be returned. If the `Filter` argument is equal to "<namespace prefix>:*", then all of the REQUIRED srs properties and all of the supported properties within that single namespace MUST be returned. For example, "srs:*" is equivalent to listing all srs namespace properties supported by the device.

Properties defined in the ContentDirectory service MUST only be imported through the multi-valued `cdsReference` property. Therefore, if the `Filter` argument contains property names from namespaces defined in the ContentDirectory service specification, the appropriate `cdsReference` property values MUST be included in the `Result` output argument and those values MUST be filtered, according to what is specified in the `Filter` argument but also preserving the validity of the DIDL-Lite XML Document, returned in the `cdsReference` property.

Examples of valid `Filter` argument values include:

- “srs:@id,srs:priority@orderedValue”
- “srs:title,dc:title”
- “*:*
- “upnp:*,dc:*,didl_lite:*”

A compliant ScheduledRecording service implementation MUST also ignore optional properties requested in the `Filter` input argument which are not actually present in the matching objects. For example, a `BrowseRecordSchedules()` `Filter` input argument of the form “srs:activePeriod” is successful and returns a `Result` value that complies with the other `BrowseRecordSchedules()` input arguments, even in the case where the objects represented in the `Result` argument do not have an `activePeriod` property defined.

2.6.5.1.2 StartingIndex and RequestedCount

This action returns a specified number of `recordSchedule` objects from the list as indicated by the `RequestedCount` argument and starting from a specified index in the list, as indicated by the `StartingIndex` argument. The first `recordSchedule` in the list MUST be indexed by an index value of 0. Specifying 0 in the `RequestedCount` argument is PROHIBITED. If the range indicated by the `StartingIndex` and `RequestedCount` arguments reaches beyond the end of the list, then the ScheduledRecording service MUST return all `recordSchedule` objects up to the end of the list and starting from the specified `StartingIndex`.

2.6.5.1.3 SortCriteria

The order of the `recordSchedule` objects in the `Result` argument is determined by the `SortCriteria` argument. When an empty string is specified in the `SortCriteria` argument, then the order is device dependent. Additionally, this device dependent ordering MUST remain constant unless the `UpdateID` argument value has changed since the last `BrowseRecordSchedules()` action. In other words, any two objects that appear in a `Result` argument MUST always appear in the same relative order as long as the `UpdateID` argument value (and therefore the `StateUpdateID` state variable) did not change.

The `SortCriteria` argument contains a CSV list of property names (namespace prefixes MUST always be included). Each property name MUST be prefixed by either a “+” or a “−” sort modifier. The “+” and “−” modifiers indicate that the sort is in ascending or descending order, respectively, with regard to the value of its associated property.

The ScheduledRecording service MUST NOT accept any property name in the `SortCriteria` argument that is not included in the `SortCapabilities` state variable.

The objects are first sorted on the value of the first property in the `SortCriteria` argument. If all values differ in the first property, the sort is finished. If any values of the first property are equal, each subset of
equal values is then sorted based on the next property in the \textit{SortCriteria} argument. This process repeats iteratively until there are no more subsets of equal values or the \textit{SortCriteria} argument list is exhausted.

For example, a value for the \textit{SortCriteria} argument of the \texttt{BrowseRecordSchedules()} action of:

```
"+srs:scheduledStartDateDateTime,-srs:scheduledChannelID,+srs:matchingName"
```

would sort the returned \texttt{recordSchedule} instances first by start date\&time in ascending order, then for each date\&time, the instances would be sorted by descending channel ID and finally, for each channel ID, the instances would be sorted by ascending program name.

Sorting rules for each property depend on that property’s semantics. Sorts for individual properties can be any of: numeric sort, lexical sort, lexical numeric sort, Boolean sort, sequenced sort, \texttt{type} relationship sort, or \textit{property specific}, according to an explicit ordering of values defined individually for that property. The definition of each kind of sort may be found in Section 2.2.2.26, “Lexical Sort Order”. The specific sort order rules that MUST be used for each property are given in Appendix B, “AV Working Committee Extended Properties”.

When a \textit{SortCriteria} argument contains property names of optional and/or multi-valued properties, the following rules apply:

If the property is prefixed by “+” then:

- Objects that do not have a value for the property are returned first in their group.
- Objects that have at least one value for the property are returned next in their group. Objects that have multiple values for the property (either multi-valued or CSV list) are sorted based on the property value that would cause the object to appear earliest in the list.

If the property is prefixed by “-” then:

- Objects that have at least one value for the property are returned first in their group. Objects that have multiple values (either multi-valued or CSV list) for the property are sorted based on the property value that would cause the object to appear earliest in the list.
- Objects that do not have a value for the property are returned last in their group.

\textbf{Example:}

Assume a ScheduledRecording service contains the following items and the current date is Tuesday, June 21, 2005:

```
<item id="1">
  ...<scheduledStartDateTime>2006-02-07T15:30:00</ScheduledStartDateTime>
  ...</item>
<item id="2">
  ...<scheduledStartDateTime>MONT15:30:00</ScheduledStartDateTime>
  <scheduledStartDateTime>WEDT15:30:00</ScheduledStartDateTime>
  ...</item>
<item id="3">
  ...<scheduledStartDateTime>MON-FRIT16:00:00</ScheduledStartDateTime>
  ...</item>
<item id="4">
  ...No <scheduledStartDateTime> property
  ...
```

© 2013, UPnP Forum. All rights Reserved.
A value for the SortCriteria argument of the BrowseRecordSchedules() action of:
“+srs:scheduledStartDateTime”

would sort the returned recordSchedule instances on Tuesday, June 21, 2005 as follows:

```xml
<item id="4"/>
<item id="2"/>
<item id="3"/>
<item id="1"/>
```

because:

- `<item id="4"/>` has no `srs:scheduledStartDateTime` property, it therefore appears first.
- `<item id="2"/>` `srs:scheduledStartDateTime` property resolves to Wednesday, 2005-06-22T15:30:00 since this is the earliest date&time in the list. It therefore appears second.
- `<item id="3"/>` `srs:scheduledStartDateTime` property resolves to Wednesday, 2005-06-22T16:00:00. It therefore appears third.
- `<item id="1"/>` `srs:scheduledStartDateTime` property resolves to Tuesday, 2006-02-07T15:30:00. It therefore appears last.

Sorting on ContentDirectory service imported properties is not supported.

2.6.5.1.4  **Result**

The Result output argument contains an XML escaped srs XML Document (see [SRS-XSD]). This document contains a set of zero or more recordSchedule objects as described in Appendix A, “srs XML Document”. Each of the returned recordSchedule objects MUST NOT have properties other than those specified in the Filter argument unless they are needed to create a valid srs XML Document. The ScheduledRecording service implementation MUST ignore unknown properties specified in the Filter argument. If “*::*” is specified in the Filter argument, then all supported properties for which the ScheduledRecording service has meaningful values MUST be returned. The REQUIRED properties (for example, @id, title, class, …) MUST always be included even if not specified in the Filter argument (the srs XML Document MUST be valid). The ScheduledRecording service implementation MUST ensure that the information returned in this argument is always consistent. In other words, if during the information gathering process, certain updates occur, the ScheduledRecording service implementation MUST re-examine the already gathered information to verify that this information is still accurate before returning from the action invocation.

2.6.5.1.5  **NumberReturned**

The NumberReturned argument MUST indicate the actual number of returned objects.

2.6.5.1.6  **TotalMatches**

The TotalMatches argument MUST indicate the total number of recordSchedule objects that exist in the ScheduledRecording service.

2.6.5.1.7  **UpdateID**

The returned UpdateID argument MUST be the value of the StateUpdateID state variable at the time the returned data has been completely and consistently collected. In other words, if during the information
gathering process, certain updates occur, the ScheduledRecording service implementation MUST re-examine the already gathered information to verify that this information is still accurate before returning from the action invocation. Refer to Section 2.4.4, “StateUpdateID” for additional information.

The UpdateID argument is used to verify whether the returned information in the Result argument has not become stale. After the action completes, if the value of the StateUpdateID state variable is different from the value returned in the UpdateID argument, then the information returned in the Result argument may be stale. In this case, the control point should invoke the appropriate action to refresh its copy of the desired information (for example, via the BrowseRecordSchedules() or GetRecordSchedule() action).

2.6.5.2 Dependency on State
None.

2.6.5.3 Effect on State
None.

2.6.5.4 Errors

Table 2-16: Error Codes for BrowseRecordSchedules()

<td>720</td>
<td>Cannot process the request</td>
<td>Cannot process the request in a reasonable amount of time.</td>
</tr>
</tbody>
</table>

2.6.6 BrowseRecordTasks()

This REQUIRED action is used to browse the list of recordTask objects associated with a single recordSchedule. In addition, it can be used to browse the entire list of all recordTask objects available in the entire ScheduledRecording service, independent of their parent recordSchedule.

The Result argument contains an XML escaped srs XML Document that contains a set of recordTask objects. When the RecordScheduleID input argument contains the @id value of an existing recordSchedule, then the Result argument returns an XML escaped srs XML Document that contains the set of recordTask objects associated with that particular recordSchedule. When the RecordScheduleID input argument is set to the empty string (""), then the Result argument returns an XML escaped srs XML Document that contains a list of all available recordTask objects in the entire ScheduledRecording service.

2.6.6.1 Arguments

Table 2-17: Arguments for BrowseRecordTasks()

<table>
<thead>
<tr>
<th>Argument</th>
<th>Direction</th>
<th>relatedStateVariable</th>
</tr>
</thead>
<tbody>
<tr>
<td>RecordScheduleID</td>
<td>IN</td>
<td>A_ARG_TYPE_ObjectID</td>
</tr>
</tbody>
</table>

© 2013, UPnP Forum. All rights Reserved.
The syntax and semantics of the arguments (the RecordScheduleID argument not included) of the BrowseRecordTasks() action are identical to those of the BrowseRecordSchedules() action, except that the objects returned by this action are recordTask objects instead of recordSchedule objects.

### 2.6.6.1.1 RecordScheduleID

The RecordScheduleID input argument contains the object ID of the recordSchedule for which all associated recordTask instances are returned in the Result argument. If the RecordScheduleID input argument contains the empty string (""), then all available recordTask instances in the entire ScheduledRecording service are returned.

### 2.6.6.1.2 Filter

See Section 2.6.5.1.1, “Filter”.

### 2.6.6.1.3 StartingIndex and RequestedCount

See Section 2.6.5.1.2, “StartingIndex and RequestedCount”.

### 2.6.6.1.4 SortCriteria

See Section 2.6.5.1.3, “SortCriteria”.

### 2.6.6.1.5 Result

See Section 2.6.5.1.4, “Result”.

### 2.6.6.1.6 NumberReturned

See Section 2.6.5.1.5, “NumberReturned”.

### 2.6.6.1.7 TotalMatches

When the RecordScheduleID input argument contains the @id value of an existing recordSchedule, then the TotalMatches argument MUST indicate the total number of recordTask objects that exist in the ScheduledRecording service for the indicated recordSchedule. When the RecordScheduleID input argument is set to the empty string (""), then the TotalMatches argument MUST indicate the total number of recordTask objects that exist in the entire ScheduledRecording service, independent of their parent recordSchedule.

</tr>
</tbody>
</table>

2.6.7 **CreateRecordSchedule()**

This REQUIRED action creates a recordSchedule (that is: a scheduled recording list entry) for some media content (for example, broadcast content, analog input content, etc). This action creates a new object of a class, derived from the recordSchedule class. Control points that want to schedule a recording invoke the CreateRecordSchedule() action.

If the CreateRecordSchedule() action returns successfully, then a new recordSchedule object is added to the list of Record Schedules maintained by the ScheduledRecording service. This list can be consulted through the BrowseRecordSchedules() action. The ScheduledRecording service MAY also instantiate one or more recordTask objects to represent the discrete recording tasks that are associated with the high level schedule, defined by the recordSchedule. The instantiation of recordTask objects may happen after the CreateRecordSchedule() action returns successfully. However, if the created recordSchedule would lead to the instantiation of one or more recordTask objects, these recordTask objects MUST be created by the ScheduledRecording service as soon as possible and within a reasonable amount of time. If any of these spawned recordTask objects end up in a state that indicates that these recordTask objects should already be recording, then the ScheduledRecording service MUST ensure that these recordings start as soon as possible and within a reasonable amount of time (this will most likely result in a partial recording). If a ScheduledRecording service implementation can not ensure that these recordings start as soon as possible, then the CreateRecordSchedule() action MUST return with error code 720 without any change.
2.6.7.1 Arguments

Table 2-19: Arguments for CreateRecordSchedule()

<table>
<thead>
<tr>
<th>Argument</th>
<th>Direction</th>
<th>relatedStateVariable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elements</td>
<td>IN</td>
<td>A_ARG_TYPE_RecordScheduleParts</td>

</tr>
<tr>
<td>Result</td>
<td>OUT</td>
<td>A_ARG_TYPE_RecordSchedule</td>
</tr>
<tr>
<td>UpdateID</td>
<td>OUT</td>
<td>StateUpdateID</td>
</tr>
</tbody>
</table>

2.6.7.1.1 Elements

The `Elements` input argument contains an XML escaped `srs XML Document` (see [SRS-XSD]). This document contains a single `recordScheduleParts`. The `recordScheduleParts` object identifies the desired property values for the `recordSchedule` object to be created. The new `recordSchedule` will be an instance of a specific `recordSchedule` class. Each class defines its set of member properties, some of which are REQUIRED, and some of which are OPTIONAL. See Appendix C, “AV Working Committee Class Definitions” for details. All REQUIRED member properties MUST be specified. If a control point omits supported OPTIONAL member properties from the `Elements` argument, then the ScheduledRecording service MUST create the `recordSchedule` with the appropriate default value for those omitted member properties. If unsupported properties or unknown properties are specified in the `Elements` argument, the ScheduledRecording service MUST gracefully accept these. If an unsupported value is specified for a supported member property, the ScheduledRecording service MUST detect this and return error code 703.

2.6.7.1.2 RecordScheduleID

If the ScheduledRecording service accepts the `recordSchedule` in the `Elements` input argument, then the ScheduledRecording service MUST provide a value in this output argument. The returned `RecordScheduleID` value MUST be a unique value within the ScheduledRecording service. `RecordScheduleID` values are assumed to be opaque values without special meaning. Although a ScheduledRecording service may choose to use a `RecordScheduleID` value that was previously assigned (and later removed from the active list of `recordSchedule` instances), this specification recommends that the `RecordScheduleID` value be unique in time as well.

2.6.7.1.3 Result

The `Result` output argument contains an XML escaped `srs XML Document` (see [SRS-XSD]). This document contains the newly created `recordSchedule` object as described in Appendix A, “srs XML Document”. Any properties specified in the input `Elements` argument MUST have the same values in the output `recordSchedule`. The ScheduledRecording service MUST return all supported member properties for which it has meaningful values. This complete set allows a control point to see the default values of those properties that it did not specify in the input `Elements` argument. Note that some properties such as `scheduleState` are defined as REQUIRED for an output `recordSchedule` and MUST be included in the returned document. Refer to Appendix C.1.1, “Relationships between Classes and Properties” for the support level of each property.

The ScheduledRecording service implementation MUST ensure that the information returned in this argument is always consistent. In other words, if during the information gathering process, certain updates occur, the ScheduledRecording service implementation MUST re-examine the already gathered information to verify that this information is still accurate before returning from the action invocation.
2.6.7.1.4 UpdateID
See Section 2.6.5.1.7, “UpdateID”.

2.6.7.2 Dependency on State
None.

2.6.7.3 Effect on State
The value of the StateUpdateID state variable is changed and the LastChange state variable is updated.

</tbody>
</table>
2.6.8 **DeleteRecordSchedule()**

The REQUIRED `DeleteRecordSchedule()` action is used to delete a specific `recordSchedule`. When the `recordSchedule` is deleted, all of the associated `recordTask` objects MUST also be deleted. The list of `Record Schedules` and their associated `recordScheduleID` currently maintained by the ScheduledRecording service can be retrieved through the `BrowseRecordSchedules()` action.

A `recordSchedule` can only be deleted when all of its associated `recordTask` objects are in the “IDLE” or the “DONE” phase. If any of the associated `recordTask` objects are in the “ACTIVE” phase, then the ScheduledRecording service MUST return with error code 705 (active `recordTask`) without any change. A control point that wants to recover from this error scenario can first delete the associated active `recordTask` objects by invoking the `DeleteRecordTask()` action on these objects and then delete the `recordSchedule`. The active `recordTask` objects can be retrieved by properly invoking the `BrowseRecordTasks()` action.

It must be noted that a ScheduledRecording service can delete a `recordSchedule` without control point intervention. For example, a non-recurring `recordSchedule` that has completed its last `recordTask` MAY (OPTIONALLY) be automatically deleted along with its associated `recordTask` objects. However, it is RECOMMENDED that a ScheduledRecording service implementation retains completed `recordSchedule` instances and their associated `recordTask` instances for a reasonable amount of time so that the user can examine potential error information after recording is completed.

### 2.6.8.1 Arguments

<thead>
<tr>
<th>ErrorCode</th>
<th>errorDescription</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>704</td>
<td>No such recordSchedule ID</td>
<td>The specified <code>recordSchedule</code> does not exist.</td>
</tr>
<tr>
<td>705</td>
<td>Active recordTask</td>
<td>One or more <code>recordTask</code> instances are actively recording.</td>
</tr>
<tr>
<td>720</td>
<td>Cannot process the request</td>
<td>Cannot process the request in a reasonable amount of time.</td>
</tr>
</tbody>
</table>

### 2.6.9 GetRecordSchedule()

This REQUIRED action is used to retrieve a single `recordSchedule` from the ScheduledRecording service.

### 2.6.9.1 Arguments

**Table 2-23: Arguments for GetRecordSchedule()**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Direction</th>
<th>relatedStateVariable</th>
</tr>
</thead>
<tbody>
<tr>
<td>RecordScheduleID</td>
<td>IN</td>
<td>A_ARG_TYPE_ObjectID</td>
</tr>
<tr>
<td>Filter</td>
<td>IN</td>
<td>A_ARG_TYPE_PropertyList</td>
</tr>
<tr>
<td>Result</td>
<td>OUT</td>
<td>A_ARG_TYPE_RecordSchedule</td>
</tr>
<tr>
<td>UpdateID</td>
<td>OUT</td>
<td>StateUpdateID</td>
</tr>
</tbody>
</table>

#### 2.6.9.1.1 RecordScheduleID

The `RecordScheduleID` contains the object ID of the `recordSchedule` for which information is to be returned.

#### 2.6.9.1.2 Filter

See Section 2.6.5.1.1, “Filter”.

#### 2.6.9.1.3 Result

The `Result` output argument contains an XML escaped `srs XML Document` that contains a single `recordSchedule` identified by the `@id` value specified in the `RecordScheduleID` argument. For further details, see Section 2.6.5.1.4, “Result”.

#### 2.6.9.1.4 UpdateID

See Section 2.6.5.1.7, “UpdateID”.

### 2.6.9.2 Dependency on State

None.

### 2.6.9.3 Effect on State

None.
2.6.9.4 Errors

Table 2-24: Error Codes for GetRecordSchedule()

<table>
<thead>
<tr>
<th>ErrorCode</th>
<th>errorDescription</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>400-499</td>
<td>TBD</td>
<td>See UPnP Device Architecture section on Control.</td>
</tr>
<tr>
<td>500-599</td>

<td>No such recordSchedule ID</td>
<td>The specified recordSchedule does not exist.</td>
</tr>
<tr>
<td>720</td>
<td>Cannot process the request</td>
<td>Cannot process the request in a reasonable amount of time.</td>
</tr>
</tbody>
</table>

2.6.10 EnableRecordSchedule()

This CONDITIONALLY REQUIRED action MUST be implemented if the DisableRecordSchedule() action is implemented, that is, these two actions MUST be implemented as a combination. The action is used to enable a previously disabled recordSchedule. Enabling a recordSchedule is allowed in any state except for the "COMPLETED" state. In this case, the action MUST return with error code 740.

The invocation of the EnableRecordSchedule() action enables all the associated recordTask objects in the "IDLE" or "ACTIVE" phase (See Section 2.6.14, "EnableRecordTask()") except for those which were disabled individually at the recordTask level via the DisableRecordTask() action. Disabling at the recordTask level always takes precedence. If any of the associated recordTask objects end up in a state that indicates that these recordTask objects should already be recording, then the ScheduledRecording service MUST ensure that these recordings start as soon as possible and within a reasonable amount of time (this will most likely result in a partial recording). If a ScheduledRecording service implementation can not ensure that these recordings start as soon as possible, then the EnableRecordSchedule() action MUST return with error code 720. If the ScheduledRecording service can not enable some of the recordTask objects in the "IDLE" or "ACTIVE" phase, it MUST return error code 740 without any change.

Enabling a recordSchedule MUST NOT affect its recordTask objects in the "DONE" phase. These recordTask objects MUST NOT cause error code 739 to be generated.

2.6.10.1 Arguments

Table 2-25: Arguments for EnableRecordSchedule()

<table>
<thead>
<tr>
<th>Argument</th>
<th>Direction</th>
<th>relatedStateVariable</th>
</tr>
</thead>
<tbody>
<tr>
<td>RecordScheduleID</td>
<td>IN</td>
<td>A_ARG_TYPE_ObjectID</td>
</tr>
</tbody>
</table>

2.6.10.1.1 RecordScheduleID

The RecordScheduleID argument contains the object ID of the recordSchedule to be enabled.

2.6.10.2 Dependency on State

None.
2.6.10.3 Effect on State
The value of the StateUpdateID state variable is changed and the LastChange state variable is updated (the scheduleState@currentErrors property and some taskState@xxx error properties might be updated).

2.6.10.4 Errors

Table 2-26: Error Codes for EnableRecordSchedule()

<table>
<thead>
<tr>
<th>ErrorCode</th>
<th>errorDescription</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>400-499</td>
<td>TBD</td>
<td>See UPnP Device Architecture section on Control.</td>
</tr>
<tr>
<td>500-599</td>
<td>TBD</td>
<td>See UPnP Device Architecture section on Control.</td>
</tr>
<tr>
<td>600-699</td>
<td>TBD</td>
<td>See UPnP Device Architecture section on Control.</td>
</tr>
<tr>
<td>704</td>
<td>No such recordSchedule ID</td>
<td>The specified recordSchedule does not exist.</td>
</tr>
<tr>
<td>720</td>
<td>Cannot process the request</td>
<td>Cannot process the request in a reasonable amount of time.</td>
</tr>
<tr>
<td>739</td>
<td>Cannot enable/disable recordSchedule</td>
<td>One or more of the associated recordTask objects could not be enabled or disabled.</td>
</tr>
<tr>
<td>740</td>
<td>recordSchedule “COMPLETED”</td>
<td>The recordSchedule has already completed and cannot be enabled or disabled.</td>
</tr>
</tbody>
</table>

2.6.11 DisableRecordSchedule()

This CONDITIONALLY REQUIRED action MUST be implemented if the EnableRecordSchedule() action is implemented, that is, these two actions MUST be implemented as a combination. The action is used to disable a recordSchedule. Disabling a recordSchedule is allowed in any state except for the “COMPLETE” state. In this case, the action MUST return with error code 740.

The invocation of the DisableRecordSchedule() action disables all associated recordTask objects in the “IDLE” phase (See Section 2.6.15, “DisableRecordTask()”) except for those which were enabled individually at the recordTask level via the EnableRecordTask() action. Enabling at the recordTask level always takes precedence. If the ScheduledRecording service can not disable some of the recordTask objects in the “IDLE” phase, it MUST return error code 739 without any change.

The DisableRecordSchedule() action has no impact on recordTask objects already in the “ACTIVE” phase. These recordTask objects complete as planned.

Also, disabling a recordSchedule MUST NOT affect its recordTask objects in the “DONE” phase. These recordTask objects MUST NOT cause error code 739 to be generated. A disabled recordSchedule MUST continue to generate new recordTask objects but they MUST all be disabled. This allows control points to understand which recordTask objects will become active, once the RecordSchedule is re-enabled. This also provides the means for a control point to enable individual recordTask objects, even when the recordSchedule is disabled.
2.6.11.1 Arguments

Table 2-27:  Arguments for DisableRecordSchedule()

<table>
<thead>
<tr>
<th>Argument</th>
<th>Direction</th>
<th>relatedStateVariable</th>
</tr>
</thead>
<tbody>
<tr>
<td>RecordScheduleID</td>
<td>IN</td>
<td>A_ARG_TYPE_ObjectID</td>
</tr>
</tbody>
</table>

2.6.11.1.1 RecordScheduleID
The RecordScheduleID argument contains the object ID of the recordSchedule to be disabled.

2.6.11.2 Dependency on State
None.

2.6.11.3 Effect on State
The value of the StateUpdateID state variable is changed and the LastChange state variable is updated (the scheduleState@currentErrors property and some taskState@xxx error properties might be updated).

2.6.11.4 Errors

Table 2-28:  Error Codes for DisableRecordSchedule()

<table>
<thead>
<tr>
<th>ErrorCode</th>
<th>errorDescription</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>400-499</td>
<td>TBD</td>
<td>See UPnP Device Architecture section on Control.</td>
</tr>
<tr>
<td>500-599</td>
<td>TBD</td>
<td>See UPnP Device Architecture section on Control.</td>
</tr>
<tr>
<td>600-699</td>
<td>TBD</td>
<td>See UPnP Device Architecture section on Control.</td>
</tr>
<tr>
<td>704</td>
<td>No such recordSchedule ID</td>
<td>The specified recordSchedule does not exist.</td>
</tr>
<tr>
<td>720</td>
<td>Cannot process the request</td>
<td>Cannot process the request in a reasonable amount of time.</td>
</tr>
<tr>
<td>739</td>
<td>Cannot enable/disable recordSchedule</td>
<td>One or more of the associated recordTask objects could not be enabled or disabled.</td>
</tr>
<tr>
<td>740</td>
<td>recordSchedule “COMPLETED”</td>
<td>The recordSchedule has already completed and cannot be enabled or disabled.</td>
</tr>
</tbody>
</table>

2.6.12 DeleteRecordTask()

This OPTIONAL action is used to delete a recordTask. For any existing recordTask, this action MUST always succeed. The recordTask object is removed from the list of recordTask objects that is maintained by the ScheduledRecording service for the (parent) recordSchedule and any ongoing recording for this recordTask MUST stop immediately. The associated recorded content for that recordTask MUST NOT be deleted as a result of this action.
2.6.12.1 Arguments

Table 2-29: Arguments for DeleteRecordTask()

<table>
<thead>
<tr>
<th>Argument</th>
<th>Direction</th>
<th>relatedStateVariable</th>
</tr>
</thead>
<tbody>
<tr>
<td>RecordTaskID</td>
<td>IN</td>
<td>A_ARG_TYPE_ObjectID</td>
</tr>
</tbody>
</table>

2.6.12.1.1 RecordTaskID

The RecordTaskID argument contains the object ID of the recordTask to be deleted.

2.6.12.2 Dependency on State

None.

2.6.12.3 Effect on State

The value of the StateUpdateID state variable is changed and the LastChange state variable is updated.

2.6.12.4 Errors

Table 2-30: Error Codes for DeleteRecordTask()

<table>
<thead>
<tr>
<th>ErrorCode</th>
<th>errorDescription</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>400-499</td>
<td>TBD</td>
<td>See UPnP Device Architecture section on Control.</td>
</tr>
<tr>
<td>500-599</td>

<td>See UPnP Device Architecture section on Control.</td>
</tr>
<tr>
<td>600-699</td>
<td>TBD</td>
<td>See UPnP Device Architecture section on Control.</td>
</tr>
<tr>
<td>713</td>
<td>No such recordTask ID</td>
<td>The specified recordTask does not exist.</td>
</tr>
</tbody>
</table>

2.6.13 GetRecordTask()

This REQUIRED action is used to retrieve a single recordTask from the ScheduledRecording service.

2.6.13.1 Arguments

Table 2-31: Arguments for GetRecordTask()

<table>
<thead>
<tr>
<th>Argument</th>
<th>Direction</th>
<th>relatedStateVariable</th>
</tr>
</thead>
<tbody>
<tr>
<td>RecordTaskID</td>
<td>IN</td>
<td>A_ARG_TYPE_ObjectID</td>
</tr>

</tr>
<tr>
<td>Result</td>
<td>OUT</td>
<td>A_ARG_TYPE_RecordTask</td>
</tr>
<tr>
<td>UpdateID</td>
<td>OUT</td>
<td>StateUpdateID</td>
</tr>
</tbody>
</table>

2.6.13.1.1 RecordTaskID

The RecordTaskID argument contains the object ID of the recordTask for which information is to be returned.
2.6.13.1.2 Filter
See Section 2.6.5.1.1, “Filter”.

2.6.13.1.3 Result
The Result output argument contains an XML escaped srs XML Document that contains a single recordTask instance, identified by the @id value specified in the RecordTaskID argument. The Result argument is identical to the Result argument of the BrowseRecordTasks() action. See Section 2.6.6.1.5, “Result” for further details.

2.6.13.1.4 UpdateID
See Section 2.6.5.1.7, “UpdateID”.

2.6.13.2 Dependency on State
None.

2.6.13.3 Effect on State
None.

2.6.13.4 Errors

Table 2-32: Error Codes for GetRecordTask()

<table>
<thead>
<tr>
<th>Error Code</th>
<th>errorDescription</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>400-499</td>

<tr>
<td>713</td>
<td>No such recordTask ID</td>
<td>The specified recordTask does not exist.</td>
</tr>
<tr>
<td>720</td>
<td>Cannot process the request</td>
<td>Cannot process the request in a reasonable amount of time.</td>
</tr>
</tbody>
</table>

2.6.14 EnableRecordTask()
This CONDITIONALLY REQUIRED action MUST be implemented if the DisableRecordTask() or the ResetRecordTask() action are implemented, that is, these three actions MUST be implemented as a combination. The action is used to first de-synchronize the recordTask enable/disable behavior from the (parent) recordSchedule and then individually enable the recordTask, if not already enabled.

- A recordTask that is enabled in the “IDLE” phase will record content in the future unless the occurrence of an error prevents that.
- A recordTask that is enabled in the “ACTIVE” phase MUST start recording content as soon as possible and within a reasonable amount of time unless the occurrence of an error prevents that. In that case, it MUST return error code 720 without any change.

Invoking EnableRecordTask() on a recordTask in the “DONE” phase MUST NOT affect the state of the recordTask and MUST fail with error code 741.
Enabling a recordTask always takes persistent precedence over enabling/disabling activities performed at the (parent) recordSchedule level. A recordTask that is enabled by invoking EnableRecordTask() remains enabled until explicitly disabled by invoking DisableRecordTask() on that recordTask. Invoking EnableRecordSchedule() or DisableRecordSchedule() on the (parent) recordSchedule does not affect the recordTask anymore. A recordTask enable/disable behavior can be re-synchronised to the (parent) recordSchedule by invoking the ResetRecordTask() action. From that point onwards, a recordTask will follow any enabling/disabling activities performed at the (parent) recordSchedule level again.

2.6.14.1 Arguments

Table 2-33: Arguments for EnableRecordTask()

<table>
<thead>
<tr>
<th>Argument</th>
<th>Direction</th>
<th>relatedStateVariable</th>
</tr>
</thead>
<tbody>
<tr>
<td>RecordTaskID</td>
<td>IN</td>
<td>A_ARG_TYPE_ObjectID</td>
</tr>
</tbody>
</table>

2.6.14.1.1 RecordTaskID

The RecordTaskID argument contains the object ID of the recordTask to be enabled.

2.6.14.2 Dependency on State

None.

2.6.14.3 Effect on State

The value of the StateUpdateID state variable is changed and the LastChange state variable is updated.

2.6.14.4 Errors

Table 2-34: Error Codes for EnableRecordTask()

<table>
<thead>
<tr>
<th>ErrorCode</th>
<th>errorDescription</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>400-499</td>
<td>TBD</td>
<td>See UPnP Device Architecture section on Control.</td>
</tr>
<tr>
<td>500-599</td>
<td>TBD</td>
<td>See UPnP Device Architecture section on Control.</td>
</tr>
<tr>
<td>600-699</td>

<td>No such recordTask ID</td>
<td>The specified recordTask does not exist.</td>
</tr>
<tr>
<td>720</td>
<td>Cannot process the request</td>
<td>Cannot process the request in a reasonable amount of time.</td>
</tr>
<tr>
<td>741</td>
<td>recordTask in “DONE” phase</td>
<td>A recordTask in the “DONE” phase cannot be enabled or disabled.</td>
</tr>
</tbody>
</table>

2.6.15 DisableRecordTask()

This CONDITIONALLY REQUIRED action MUST be implemented if the EnableRecordTask() or the ResetRecordTask() action are implemented, that is, these three actions MUST be implemented as a combination. The action is used to first de-synchronize the recordTask enable/disable behavior from the (parent) recordSchedule and then individually disable the recordTask, if not already disabled. A disabled recordTask MUST behave identical to an enabled recordTask, except for the following:
• A disabled recordTask in the “IDLE” phase MUST report error code 101 (Disabled) in the taskState@pendingErrors property.

• A disabled recordTask in the “ACTIVE” phase MUST NOT record content and it MUST report error code 101 (Disabled) in the taskState@currentErrors and taskState@errorHistory properties.

When a recordTask in the “ACTIVE” phase is disabled, it MUST stop recording immediately. If that is not possible, it MUST return error code 720 without any change. Invoking DisableRecordTask() on a recordTask in the “DONE” phase MUST NOT affect the state of the recordTask and MUST fail with error code 741.

Disabling a recordTask always takes persistent precedence over enabling/disabling activities performed at the (parent) recordSchedule level. A recordTask that is disabled by invoking DisableRecordTask() remains disabled until explicitly re-enabled by invoking EnableRecordTask() on that recordTask. Invoking EnableRecordSchedule() or DisableRecordSchedule() on the (parent) recordSchedule does not affect the recordTask anymore. A recordTask enable/disable behavior can be re-synchronised to the (parent) recordSchedule by invoking the ResetRecordTask() action. From that point onwards, a recordTask will follow any enabling/disabling activities performed at the (parent) recordSchedule level again.

2.6.15.1 Arguments

Table 2-35: Arguments for DisableRecordTask()

<table>
<thead>
<tr>
<th>Argument</th>
<th>Direction</th>
<th>relatedStateVariable</th>
</tr>
</thead>
<tbody>
<tr>
<td>RecordTaskID</td>
<td>IN</td>
<td>A_ARG_TYPE_ObjectID</td>
</tr>
</tbody>
</table>

2.6.15.1.1 RecordTaskID

The RecordTaskID argument contains the object ID of the recordTask to be disabled.

2.6.15.2 Dependency on State

None.

2.6.15.3 Effect on State

The value of the StateUpdateID state variable is changed and the LastChange state variable is updated.

2.6.15.4 Errors

Table 2-36: Error Codes for DisableRecordTask()

<table>
<thead>
<tr>
<th>ErrorCode</th>
<th>errorDescription</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>400-499</td>

<td>No such recordTask ID</td>
<td>The specified recordTask does not exist.</td>
</tr>
<tr>
<td>720</td>
<td>Cannot process the request</td>
<td>Cannot process the request in a reasonable amount of time.</td>
</tr>
</tbody>
</table>
2.6.16 **ResetRecordTask()**

This CONDITIONALLY REQUIRED action MUST be implemented if the `EnableRecordTask()` or the `DisableRecordTask()` action are implemented, that is, these three actions MUST be implemented as a combination. The action is used to force a previously enabled or disabled `recordTask` to follow any enabling/disabling activities performed at the (parent) `recordSchedule` level again.

If the (parent) `recordSchedule` is in the “**ENABLED**” state, then the effect of invoking the `ResetRecordTask()` action on an associated `recordTask` is identical to invoking the `EnableRecordTask()` action on that `recordTask` and from that point onwards, following any enabling/disabling activities performed at the (parent) `recordSchedule` level again for that `recordTask`.

If the (parent) `recordSchedule` is in the “**DISABLED**” state, then the effect of invoking the `ResetRecordTask()` action on an associated `recordTask` is identical to invoking the `DisableRecordTask()` action on that `recordTask` and from that point onwards, following any enabling/disabling activities performed at the (parent) `recordSchedule` level again for that `recordTask`.

**2.6.16.1 Arguments**

**Table 2-37:** Arguments for **ResetRecordTask()**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Direction</th>
<th>relatedStateVariable</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>RecordTaskID</code></td>
<td>IN</td>
<td>A_ARG_TYPE_ObjectID</td>
</tr>
</tbody>
</table>

**2.6.16.1.1 RecordTaskID**

The `RecordTaskID` argument contains the object ID of the `recordTask` to be reset.

**2.6.16.2 Dependency on State**

None.

**2.6.16.3 Effect on State**

The value of the `StateUpdateID` state variable is changed and the `LastChange` state variable is updated.

**2.6.16.4 Errors**

**Table 2-38:** Error Codes for **ResetRecordTask()**

<table>
<thead>
<tr>
<th>ErrorCode</th>
<th>errorDescription</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>741</td>
<td>recordTask in “DONE” phase</td>
<td>A <code>recordTask</code> in the “DONE” phase cannot be enabled or disabled.</td>
</tr>
</tbody>
</table>

© 2013, UPnP Forum. All rights Reserved.
2.6.17 **GetRecordScheduleConflicts()**

This CONDITIONALLY REQUIRED action MUST be supported if the ScheduledRecording service implementation allows conflicting recordSchedule instances to be created. The action returns a CSV list of recordSchedule objects that conflict with the recordSchedule indicated by the RecordScheduleID argument.

### 2.6.17.1 Arguments

**Table 2-39: Arguments for GetRecordScheduleConflicts()**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Direction</th>
<th>relatedStateVariable</th>
</tr>
</thead>
<tbody>
<tr>
<td>RecordScheduleID</td>
<td>IN</td>
<td>A_ARG_TYPE_ObjectID</td>
</tr>
<tr>
<td>RecordScheduleConflictIDList</td>
<td>OUT</td>
<td>A_ARG_TYPE_ObjectIDList</td>
</tr>
<tr>
<td>UpdateID</td>
<td>OUT</td>
<td>StateUpdateID</td>
</tr>
</tbody>
</table>

#### 2.6.17.1.1 RecordScheduleID

The RecordScheduleID argument contains the object ID of the recordSchedule for which all conflicting recordSchedule object ID values are to be returned in the RecordScheduleConflictIDList output argument.

#### 2.6.17.1.2 RecordScheduleConflictIDList

This output argument contains the CSV list of recordSchedule object IDs that conflict with the recordSchedule, indicated by the RecordScheduleID argument.

#### 2.6.17.1.3 UpdateID

The returned UpdateID argument MUST contain the most recent value of the StateUpdateID state variable before the action began collecting information to create the value returned in the RecordScheduleConflictIDList argument. This ensures that any changes that occur during the gathering of information can be detected by comparing the value of the UpdateID argument to the updateID attribute value in the most recent LastChange event. Refer to Section 2.4.4, “StateUpdateID” for more detailed information on the use of this argument.

### 2.6.17.2 Dependency on State

None.

### 2.6.17.3 Effect on State

None.
2.6.17.4 Errors

Table 2-40: Error Codes for GetRecordScheduleConflicts()

<table>
<thead>
<tr>
<th>ErrorCode</th>
<th>errorDescription</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>400-499</td>
<td>TBD</td>
<td>See UPnP Device Architecture section on Control.</td>

</tr>
</tbody>
</table>

2.6.18 GetRecordTaskConflicts()

This CONDITIONALLY REQUIRED action MUST be supported if the ScheduledRecording service implementation allows conflicting recordTask instances to be created. The action returns a CSV list of @id values of all the recordTask instances that conflict with the recordTask indicated by the RecordTaskID argument.

2.6.18.1 Arguments

Table 2-41: Arguments for GetRecordTaskConflicts()

<table>
<thead>
<tr>
<th>Argument</th>
<th>Direction</th>
<th>relatedStateVariable</th>
</tr>
</thead>
<tbody>
<tr>
<td>RecordTaskID</td>
<td>IN</td>
<td>A_ARG_TYPE_ObjectID</td>
</tr>
<tr>
<td>RecordTaskConflictIDList</td>
<td>OUT</td>
<td>A_ARG_TYPE_ObjectIDList</td>
</tr>
<tr>
<td>UpdateID</td>
<td>OUT</td>
<td>StateUpdateID</td>
</tr>
</tbody>
</table>

2.6.18.1.1 RecordTaskID

The RecordTaskID argument contains the object ID of the recordTask for which all conflicting recordTask object ID values are to be returned in the RecordTaskConflictIDList output argument.

2.6.18.1.2 RecordTaskConflictIDList

This output argument contains the CSV list of recordTask object IDs that conflict with the recordTask, indicated by the RecordTaskID argument.

2.6.18.1.3 UpdateID

The returned UpdateID argument MUST contain the most recent value of the StateUpdateID state variable before the action began collecting information to create the value returned in the RecordTaskConflictIDList argument. This ensures that any changes that occur during the gathering of information can be detected by comparing the value of the UpdateID argument to the updateID attribute value in the most recent LastChange event. Refer to Section 2.4.4, “StateUpdateID” for more detailed information on the use of this argument.
2.6.18.2 Dependency on State
None.

2.6.18.3 Effect on State
None.

2.6.18.4 Errors

Note: 800-899 Error Codes are not permitted for standard actions. See UPnP Device Architecture section on Control for more details.
2.7 State Diagram of recordTask

In the ScheduledRecording service, the state of each recordTask is represented by its state properties (that is: taskState and its associated properties taskState@xxx). The definitions are described in Appendix B.16, “Task State Properties”. Additionally, the state behavior of a recordTask is illustrated by a state diagram to give a visual description of each state and the state transitions. State diagrams are provided for informational purposes. Whenever there is a discrepancy between the state diagram and the textual description of state and state transition, the normative textual description takes precedence.

2.7.1 A Full-Featured State Diagram

As described above, the taskState property reflects the current state of the recordTask. Its value changes over time as the recordTask progresses through its life-cycle. The following state transition diagram shows the possible states and state transitions that a given recordTask may take throughout its life time. It is assumed that all (REQUIRED and OPTIONAL) normative states and attributes of a recordTask are supported by the device. Further, it is assumed that a device is able to resume recording in the middle of the “ACTIVE” phase. The GetAllowedValues() action can be used to determine if a device supports all states and attributes.
Figure 5: A Full-Featured State Diagram

- **PH** = @phase property
- **STM** = @startTime property
- **ETM** = @endTime property
- **Rec** = @recording property
- **SBR** = @someBitsRecorded property
- **FBR** = @firstBitsRecorded property
- **LBR** = @lastBitsRecorded property
- **SBM** = @someBitsMissing property
- **CE** = @currentErrors property
- **EH** = @errorHistory property
- **PE** = @pendingErrors property
- **Info** = @infoList property
- **⇒** = Transition causes a new value to be set
- **⇒ ?** = Transition target determined by current value

Transition causes a new value to be set and triggers a transition when set to new value.
2.7.1.1 “IDLE” Phase

The states in this phase indicate that the recordTask’s start time has not yet been reached and that the target content is not yet available for recording. The recordTask will remain in the “IDLE” phase (that is: in any of the IDLE states), until either the recordTask’s start time is reached or a fatal error is detected. If/when the start time is reached, the recordTask will transition to one of the states in the “ACTIVE” phase. If a fatal error is detected, the recordTask will transition directly to the “DONE.EMPTY” state within the “DONE” phase.

2.7.1.1.1 “IDLE.READY” State

This state indicates that the recordTask is waiting for the start time to be reached and that no error conditions (either fatal or non-fatal) have been detected. If/when the start time is reached, the recordTask will transition to one of the states in the “ACTIVE” phase. If, while waiting for the start time, a non-fatal error is detected, the recordTask will transition to the “IDLE.ATRISK” state indicating that the recordTask is at risk of not completing successfully due to some non-fatal error condition.

2.7.1.1.2 “IDLE.ATRISK” State

This state indicates that the recordTask is waiting for the start time to be reached, but that at least one non-fatal error condition has been detected. If/when the start time is reached, the recordTask will transition to one of the states in the “ACTIVE” phase. If, while waiting for the start time, the non-fatal error is resolved, the recordTask will transition back to the “IDLE.READY” state.

2.7.1.2 “ACTIVE” Phase

The states in this phase indicate that the recordTask’s start time has been reached and that the target content is available for recording. While in this phase (that is: in one of these states), the device will attempt to record the content. The recordTask will remain in this phase until either the recordTask’s end time is reached (that is: the content is no longer available) or until a fatal error is detected. If/when the end time is reached, the recordTask will transition to the appropriate “DONE” state based on how much of the content was recorded (that is: all – “DONE.FULL”, part – “DONE.PARTIAL”, or none – “DONE.EMPTY”). If a fatal error is detected, the recordTask will transition to either the “DONE.PARTIAL” or the “DONE.EMPTY” state, depending on how much of the content was recorded (that is: part or none).

2.7.1.2.1 “ACTIVE.TRANSITION.FROMSTART” State

This state indicates that the recordTask is attempting to begin recording the recordTask’s content from the beginning of the designated start time. The recordTask remains in this state until either the device actually begins recording data to the media or until a non-fatal or fatal error occurs. If the device actually starts to record data to the media, the recordTask will transition to “ACTIVE.RECORDING.FROMSTART” states where the content continues to be recorded. If the initial recording attempt fails due to a non-fatal error, the recordTask transitions to the “ACTIVE.NOTRECORDING” state where one or more attempts is made to resolve the problem and re-start the recording. If a fatal error is detected, the recordTask will transition to either the “DONE.PARTIAL” or the “DONE.EMPTY” state, depending on how much of the content was actually recorded (that is: part or none).

Although the recordTask remains in this state for a relatively short period of time, this state bridges an inherent discontinuity between the “IDLE” states and the “ACTIVE” states. Specifically, at the instant when the recordTask’s start time is reached, the recordTask (by definition) must transition out of the “IDLE” phase and into the “ACTIVE” phase. However, since the device has not yet attempted to record any content data on to the media, it is unknown which “ACTIVE” state the recordTask should transition to. Firstly, it is not appropriate to transition to any of the “ACTIVE.RECORDING.xxx” states because the
device has not yet actually recorded any content data. Secondly, it is not appropriate to transition to the “ACTIVE.NOTRECORDING” state because this state (by definition) means that a non-fatal error has occurred resulting in the loss of content. Since no other “ACTIVE” states are appropriate at this instant in time, the “ACTIVE.TRANSITION.xxx” states exist as a brief transition point while the true disposition of the recordTask is determined.

2.7.1.2.2 “ACTIVE.TRANSITION.RESTART” State
This state indicates that the recordTask is attempting to re-start the recording of the recordTask’s content some time after the beginning of the designated start time. This implies that either the initial recording attempt failed or that the initial recording attempt succeeded, but was later disrupted due to a non-fatal error. The recordTask remains in this state until either the device actually begins recording data to the media or until a non-fatal or fatal error occurs. If the device actually starts to record data to the media, the recordTask will transition to “ACTIVE.RECORDING.RESTART” states where the content continues to be recorded. If the initial recording attempt fails due to a non-fatal error, the recordTask transitions to the “ACTIVE.NOTRECORDING” state where one or more attempts is made to resolve the problem and re-attempt to start the recording. If a fatal error is detected, the recordTask will transition to either the “DONE.PARTIAL” or the “DONE.EMPTY” state, depending on how much of the content was recorded (that is: part of none).

Although the recordTask remains in this state for a relatively short period of time, this state bridges an inherent discontinuity between the “ACTIVE.NOTRECORDING” state and the “ACTIVE.RECORDING.xxx” states. Specifically, at the instant when a current non-fatal error has been resolved, the recordTask (by definition) must transition out of the “ACTIVE.NOTRECORDING” state and into one of the other “ACTIVE” states. However, since the device has not yet attempted to restart the recording of content data on to the media, it is unknown which “ACTIVE” state the recordTask should transition to. Firstly, it is not appropriate to transition to any of the “ACTIVE.RECORDING.xxx” states because the device has not yet actually (re)started to record any content data. Secondly, it is not appropriate to transition back to the “ACTIVE.NOTRECORDING” state because there are no unresolved non-fatal errors. Since no other “ACTIVE” states are appropriate at this instant in time, the “ACTIVE.TRANSITION.xxx” states exists as a brief transition point while the true disposition of the recordTask is determined.

2.7.1.2.3 “ACTIVE.RECORDING.FROMSTART.OK” State
This state indicates that the recordTask has reached its start time and that all of the target content has been recorded continuously from the beginning. Additionally, no non-fatal or fatal errors have occurred or have been detected which would otherwise threaten the future continuity of the recording. The recordTask remains in this state until either the recordTask’s end time is reached or until a non-fatal or fatal error occurs or a pending non-fatal or fatal error is detected.

If the recordTask reaches its end time, the recordTask halts the recording and transitions to the “DONE.FULL” state indicating that the entire target content was recorded uninterrupted. If a non-fatal error actually occurs, the recording has already halted and the recordTask transitions to the “ACTIVE.NOTRECORDING” state where one or more attempts are made to resolve the problem and restart the recording. If a fatal error actually occurs, the recording has already halted and the recordTask transitions directly to the “DONE.PARTIAL” state indicating that part of the target content was recorded. If a pending non-fatal or fatal error is detected (but has not yet occurred), the recordTask transitions to the “ACTIVE.RECORDING.FROMSTART.ATRISK” state indicating that the target content has been recorded continuously from the beginning, but a pending error has been detected that threatens the remainder of the recording.
2.7.1.2.4 **ACTIVE.RECORDING.FROMSTART.ATTRISK** State

This state indicates that the recordTask has reached its start time and that all of the target content has been recorded continuously from the beginning. Although no non-fatal or fatal errors have occurred, one or more pending non-fatal or fatal errors have been detected that threaten the future continuity of the recording. The recordTask remains in this state until either the recordTask’s end time is reached or until all of the pending non-fatal and fatal errors have been resolved or until a non-fatal or fatal error actually occurs.

If the recordTask reaches its end time, the recordTask halts the recording and transitions to the “DONE.FULL” state indicating that the entire target content was recorded uninterrupted. If all of the pending errors have been resolved, the recordTask transitions to the “ACTIVE.RECORDING.FROMSTART.OK” state indicating that the target content has been recorded continuously from the beginning and that no pending non-fatal or fatal errors have been detected. If a non-fatal error actually occurs, the recording has already halted and the recordTask transitions to the “ACTIVE.NOTRECORDING” state where one or more attempts are made to resolve the problem and restart the recording. If a fatal error actually occurs, the recording has already halted and the recordTask transitions directly to the “DONE.PARTIAL” state indicating that part of the target content was recorded.

2.7.1.2.5 **ACTIVE.RECORDING.RESTART.OK** State

This state indicates that the recordTask has reached its start time and that the target content data is being recorded onto the media. However, at some point in the past, the recording was disrupted either at the beginning or somewhere in the middle so that part of the content was not recorded. Fortunately, no pending non-fatal or fatal errors have been detected which would otherwise threaten the future continuity of the recording. The recordTask remains in this state until either the recordTask’s end time is reached or until a non-fatal or fatal actually occurs or a pending non-fatal or fatal error is detected.

If the recordTask reaches its end time, the recordTask halts the recording and transitions to the “DONE.PARTIAL” state indicating that part, but not all, of the target content was recorded. If a non-fatal error actually occurs, the recording has already halted and the recordTask transitions to the “ACTIVE.NOTRECORDING” state where one or more attempts are made to resolve the problem and again restart the recording. If a fatal error actually occurs, the recording has already halted and the recordTask transitions directly to the “DONE.PARTIAL” state indicating that part of the target content was recorded.

2.7.1.2.6 **ACTIVE.RECORDING.RESTART.ATTRISK** State

This state indicates that the recordTask has reached its start time and that the target content data is being recorded onto the media. However, at some point in the past, the recording was disrupted either at the beginning or somewhere in the middle so that part of the content was not recorded. Additionally, one or more pending non-fatal or fatal errors have been detected that threaten the future continuity of the recording. The recordTask remains in this state until either the recordTask’s end time is reached or until all of the pending non-fatal and fatal errors have been resolved or until a non-fatal or fatal actually occurs.

If the recordTask reaches its end time, the recordTask halts the recording and transitions to the “DONE.PARTIAL” state indicating that part, but not all, of the target content was recorded. If all of the pending errors have been resolved, the recordTask transitions to the “ACTIVE.RECORDING.RESTART.OK” state indicating that the target content continues to be recorded, but with some content missing, and that no pending non-fatal or fatal errors have been detected. If a non-fatal error actually occurs, the recording has already halted and the recordTask transitions to the “ACTIVE.NOTRECORDING” state where one or more attempts are made to resolve the problem and again restart.
the recording. If a fatal error actually occurs, the recording has already halted and the recordTask transitions directly to the “DONE.PARTIAL” state indicating that part of the target content was recorded.

2.7.1.2.7 “ACTIVE.NOTRECORDING” State
This state indicates that a non-fatal error has occurred while the device was recording the target content or while the device was attempting to start recording the target content. The recordTask remains in this state until either the recordTask’s end time is reached or until all of the current non-fatal errors are resolved, or until a fatal error actually occurs.

If the recordTask reaches its end time, the recordTask transitions to either the “DONE.PARTIAL” or “DONE.EMPTY” depending on how much of the content was actually recorded (that is: part or none). If all of the current non-fatal errors have been resolved, the recordTask transitions to the “ACTIVE.TRANSITION.RESTART” state where one or more attempts are made to restart the recording. If a fatal error is detected, the recordTask transitions to either the “DONE.PARTIAL” or the “DONE.EMPTY” state depending on how much of the content was actually recorded (that is: part or none).

2.7.1.3 “DONE” Phase
The states in this phase indicate that the device is finished with this recordTask. Each “DONE” state indicates the success or failure of the recordTask based on how much of the target content was actually recorded. Once the recordTask reaches one of the “DONE” states, it remains in that state until the recordTask is deleted and none of the recordTask’s property values change.

2.7.1.3.1 “DONE.FULL” State
This state indicates that all of the recordTask’s target content was recorded in its entirety without any interruptions. No error occurred while recording the target content. The recordTask remains in this state until the recordTask is deleted.

2.7.1.3.2 “DONE.PARTIAL” State
This state indicates that part of the recordTask’s target content was recorded, but not all of it. One or more errors occurred while recording the target content that prevented part of that content from being recorded. The recordTask remains in this state until the recordTask is deleted.

2.7.1.3.3 “DONE.EMPTY” State
This state indicates that none of the recordTask’s target content was recorded. One or more errors occurred that prevented the recording from even getting started. The recordTask remains in this state until the recordTask is deleted.

2.7.2 A Minimal-Implementation State Diagram
The simplest state diagram based on the minimum required state related properties is illustrated below to show the behavior of such a device and the progression of its state. The support level of these state related properties is defined in Appendix C.3.2, “object.recordTask Class”. This example only uses the set of REQUIRED allowed values for the taskState property. In the example below, it is assumed that the device is UNABLE to resume recording once the “ACTIVE” phase is entered. By definition, any device MUST support at least the following 5 illustrated states.
Figure 6: A Minimal-Implementation State Diagram
2.7.2.1 “IDLE” Phase
In this phase, the device is not able to detect pending errors (that is: taskState@pendingErrors MUST be empty); therefore, once the start time is reached, the device will go to the “ACTIVE.RECORDING.FROMSTART.OK” state and start recording. If the device can not start recording, it is treated as a fatal error, and the recordTask will transition directly to the “DONE.EMPTY” state. Also, anytime during the “IDLE” phase, a fatal error can occur, and the recordTask will transition directly to the “DONE.EMPTY” state.

2.7.2.1.1 “IDLE.READY” State
Because there is no error detecting mechanism (that is: taskState@pendingErrors) supported, this state indicates that the recordTask is waiting for the start time to be reached and that no errors conditions (either fatal or non-fatal) have been detected. If/when the start time is reached, the recordTask will attempt to record immediately.

2.7.2.1.2 “IDLE.ATRISK” State
Because there is no error detecting mechanism (that is: taskState@pendingErrors) supported, this state is not supported.

2.7.2.2 “ACTIVE” Phase
Because there is no pending error (that is: taskState@pendingErrors) detection mechanism supported, nor is an interrupted “ACTIVE” recording or late recording (that is: the start time is missed) able to resume recording (due to device limitations), only one state MUST be supported in the “ACTIVE” phase, that is: “ACTIVE.RECORDING.FROMSTART.OK”. It indicates a perfect recording condition.

2.7.2.2.1 “ACTIVE.TRANSITION.FROMSTART” State
This state is not supported.

2.7.2.2.2 “ACTIVE.TRANSITION.RESTART” State
This state is not supported.

2.7.2.2.3 “ACTIVE.RECORDING.FROMSTART.OK” State
This is the only state that MUST be supported in the “ACTIVE” phase. It indicates the perfect recording condition. The recordTask has reached its start time and all of the target content has been recorded continuously from the beginning. The recordTask remains in this state until either the recordTask’s end time is reached or until a fatal error is detected.

If the recordTask reaches its end time, the recordTask halts the recording and transitions to the “DONE.FULL” state indicating that the entire target content was recorded uninterrupted. If the recording is interrupted for any reason, it is treated as a fatal error, and the recordTask immediately transitions to either the “DONE.PARTIAL” or the “DONE.EMPTY” state.

2.7.2.2.4 “ACTIVE.RECORDING.FROMSTART.ATRISK” State
This state is not supported since the device does not support pending errors.

2.7.2.2.5 “ACTIVE.RECORDING.RESTART.OK” State
This state is not supported since the device can not resume an interrupted recording or catch a late recording that misses the beginning.

© 2013, UPnP Forum. All rights Reserved.
2.7.2.2.6 "**ACTIVE.RECORDING.RESTART.ATRISK**" State
This state is not supported since the device does not support pending errors.

2.7.2.2.7 "**ACTIVE.NOTRECORDING**" State
This state is not supported since the device cannot resume interrupted recording. Any interruptions during the middle of recording will cause a transition to the "**DONE**" phase.

2.7.2.3 "**DONE**" Phase
The states in this phase indicate that the device is finished with this `recordTask`. Each "**DONE**" state indicates the success or failure of the `recordTask` based on how much of the target content was actually recorded.

2.7.2.3.1 "**DONE.FULL**" State
This state indicates a perfect recording. The `recordTask`’s target content was recorded in its entirety without any interruptions.

2.7.2.3.2 "**DONE.PARTIAL**" State
This state indicates that part of the `recordTask`’s target content was recorded, but not all of it. This state is reached from an "**ACTIVE** `recordTask` due to a fatal error.

2.7.2.3.3 "**DONE.EMPTY**" State
This state indicates that none of the `recordTask`’s target content was recorded. It is a result of a recording that has never been started due to a fatal error.

2.7.3 `recordTask` State Example
The following example illustrates the use of state attributes. In this example, it is assumed that a device is able to resume a recording after it is interrupted.

The events occur at:
- T0: System is idle.
- T1: Error 1 (for example, DRM protected is being broadcast) and Error 3 (for example, conflicted-loser) are predicted.
- T2: The `recordSchedule` reaches the scheduled start time, but Error 1 prevents the recording from starting.
- T3: Suddenly, a new Error 2 occurs (for example, disabled)
- T4: Error 1 is fixed (for example, the protected part ends.), but Error 3 is still predicted.
- T5: Error 2 is fixed (for example, enabled by user), but Error 3 is still predicted.
- T6: Error 3 occurs (for example, other prioritized program starts)
- T7: Error 3 is fixed (for example, the prioritized program ends)
- T8: The `recordSchedule` reached the scheduled end time
### Table 2-44: recordTask State Timeline

| Recording Schedule Time Line | Recording Schedule Error | Error 1 | Error 2 | Error 3 | taskState | @phase | @startTime | @endTime | @firstBitRecorded | @lastBitRecorded | @fatalError | @currentErrors | @pendingErrors | @errorHistory |
|-----------------------------|--------------------------|--------|--------|--------|-----------|--------|----------|--------|--------------|--------------|------------|--------------|--------------|---------------|-------------|
| T0                          | “IDLE.READY”             | “IDLE” | 0      | 0      | 0         | 0      | 0        | 0      | 0            | 0            | Ø          | Ø            | Ø            | Ø             | Ø           |
| T1                          | “IDLE.ATRISK”            | “IDLE” | 0      | 0      | 0         | 0      | 0        | 0      | 0            | 0            | Ø          | 1,3          | Ø            | Ø             | Ø           |
| T2                          | “ACTIVE.NOTRECORDING”    | “ACTIVE”| 0    | 0      | 0         | 0      | 0        | 0      | 0            | 0            | 1          | 3            | 1            | 1             | 1           |
| T3                          | “ACTIVE.NOTRECORDING”    | “ACTIVE”| 0    | 0      | 0         | 0      | 0        | 0      | 1            | 2            | 3          | 1,2          | 1,2          | 1,2           | 1,2         |
| T4                          | “ACTIVE.NOTRECORDING”    | “ACTIVE”| 0    | 0      | 0         | 0      | 0        | 0      | 1            | 2            | 3          | 1,2          | 1,2          | 1,2           | 1,2         |
| T5                          | “ACT.RECORDING.RESTART.ATRISK” | “ACTIVE”| 1    | 1      | 1         | 0      | 0        | 0      | 0            | 0            | Ø          | 3            | 1            | 1             | 1,2         |
| T6                          | “ACTIVE.NOTRECORDING”    | “ACTIVE”| 0    | 0      | 0         | 0      | 0        | 0      | 0            | 0            | 3          | Ø            | Ø            | Ø             | 1,2,3       |

### 2.8 ScheduledRecording Service Priority Model

#### 2.8.1 Introduction of the ScheduledRecording Service Priority Model

The ScheduledRecording service priority model allows control points to provide desired priority information in order to help the ScheduledRecording service prioritize conflicting recordTask instances that were generated by different recordSchedule instances. The ScheduledRecording service priority model does not remove these conflicts from the system, but it does help the ScheduledRecording service make scheduling decisions that more closely match the desires of the end-user.

The ScheduledRecording service priority model is based on a “priority level” system in which each recordSchedule is assigned a specific priority level. The recordTask inherits the priority of its parent recordSchedule. In other words, the recordTask instances generated by a recordSchedule of a higher priority level are given higher priority than those recordTask instances generated by a recordSchedule of a lower priority level. Except for those ScheduledRecording service implementations that support “ordered priority” (described below), all of the recordTask instances generated by any of the recordSchedule instances assigned to the same priority level will have the same priority. If conflicts arise between any of these (same priority) recordTask instances, the ScheduledRecording service MAY give preference to any of these recordTask instances in a device-dependant manner.

The number of distinct priority levels supported by a ScheduledRecording service is vendor-dependent. Each priority level is identified by its name which MUST have the form “L<x>” where “L” is an abbreviation for “Level” and <x> is a number ranging from 1 to some device-specific maximum value n where n is the total number of distinct priority levels supported by the ScheduledRecording service.

For example, a ScheduledRecording service that supports 5 distinct priority levels will have the following priority levels named as follows:

- “L1” (Highest priority level)
• “L2”
• “L3”
• “L4”
• “L5” (Lowest priority level)

The list of priority levels supported by a ScheduledRecording service is obtainable via the
GetAllowedValues() action by examining the allowed value list of the priority property. Each existing
recordSchedule (on a given ScheduledRecording service) MUST be assigned one of these supported
priority levels. The priority property of each recordSchedule indicates the current priority level assigned
to that recordSchedule which can be retrieved via the BrowseRecordSchedules() action.

2.8.2 Ordered Priority within Each Priority Level

In addition to supporting one or more priority levels, some ScheduledRecording service implementations
are able to prioritize the recordSchedule instances within each priority level. When ordered priority is
supported, each recordSchedule (in addition to its assigned priority level) is also assigned a unique
“ordered priority slot” ranging from 1 to <n> where <n> is the total number of recordSchedule instances
within the ScheduledRecording service. A value of 1 represents the highest priority recordSchedule within
the ScheduledRecording service; that is: the highest priority recordSchedule within the highest priority
level “L1”. The value <n> represents the lowest priority recordSchedule within the ScheduledRecording
service; that is: the lowest recordSchedule within the lowest priority level. The ordered priority slot
assigned to each recordSchedule can be obtained via the recordSchedule’s priority@orderedValue
property. A ScheduledRecording service that support ordered priority MUST expose this property for each
of their recordSchedule instances. Conversely, a ScheduledRecording service that does not support this
capability MUST NOT expose the priority@orderedValue property. Within a given ScheduledRecording
service, each ordered priority slot is assigned to exactly one recordSchedule.

As a natural consequence, the recordSchedule instances assigned to a higher priority level will always
have a higher ordered priority than the recordSchedule instances assigned to a lower priority levels.

The following examples shows a ScheduledRecording service that supports ordered priority values within
each of its 5 priority levels. The first example shows a ScheduledRecording service with fewer
recordSchedule instances than the number of priority levels supported by that ScheduledRecording service.
The second example shows a ScheduledRecording service with more recordSchedule instances than the
number of priority levels supported by the ScheduledRecording service.

Of particular note, recordSchedule instances do not need to be evenly distributed between the different
priority levels. Ordered priority slots are contiguously assigned starting with the highest priority
recordSchedule down to the lowest priority recordSchedule.

Table 2-45: Example 1: Fewer recordSchedule instances than the Number of Supported Priority Levels.

<table>

</tbody>
</table>

### 2.8.3 Setting the Initial Priority Level of a recordSchedule

The initial priority level of a recordSchedule is determined by the ScheduledRecording service when the recordSchedule is created. When determining the initial priority level, the ScheduledRecording service MUST examine the recordSchedule’s incoming desiredPriority property, and if provided, set the recordSchedule’s initial priority level as indicated. If the desiredPriority property is not set, then the ScheduledRecording service MUST assign the recordSchedule to one of the supported priority levels based on some device-dependent assignment algorithm. As described below, the desiredPriority property can be set to one of many different values which allow control points to express the desired priority in a number of different ways. The GetAllowedValues() action can be used to determine which values a ScheduledRecording service allows for its desiredPriority property.

The desiredPriority property has an associated desiredPriority@type property that MUST be set to “PREDEF” except when an object ID is specified in the desiredPriority property. In this case the desiredPriority@type property MUST be set to “OBJECTID” (see below for details).

In the simplest case, the incoming desiredPriority property is set to the name of one of the supported priority levels. This value indicates that the recordSchedule MUST be assigned to the specified priority level. If the ScheduledRecording service is not able to complete the assignment, then it MUST fail the creation request.

If a control point does not have a desired priority for a recordSchedule that it is about to create, the control point may set the incoming desiredPriority property to the value “DEFAULT”. This value indicates that the control point is willing to accept the ScheduledRecording service’s default priority level assignment.

If the ScheduledRecording service supports ordered priority (that is: the ScheduledRecording service supports the priority@orderedValue property), the ScheduledRecording service MUST also support some additional values for its desiredPriority property. Firstly, the ScheduledRecording service MUST support a value with the following format (without the double-quotes): “<@id>” where <@id> is the @id property value of an already existing recordSchedule. (The associated desiredPriority@type property MUST be set to “OBJECTID” in this case). This value indicates that the new recordSchedule MUST be assigned to the same priority level as the existing recordSchedule identified by <@id>. Furthermore, the new recordSchedule MUST be assigned the ordered priority slot of the existing recordSchedule with the existing recordSchedule and all other lower priority recordSchedule instances shifted to the next lower ordered priority slot. (See examples below.)

Additionally, when ordered priority is supported, the ScheduledRecording service MUST also support a number of convenience values corresponding to the highest and lowest ordered priority slots within each of its supported priority level. These convenience values MUST have the form “L<x>_HI” or “L<x>_LOW” where “L” is an abbreviation for “Level”, <x> is a number ranging from 1 to some device-specific maximum value n where n is the total number of distinct priority levels supported by the ScheduledRecording service when the recordSchedule is created.
ScheduledRecording service. For example, a ScheduledRecording service that supports 5 priority levels and also ordered priority MUST support the values “L1 HI”, “L1 LOW”, “L2 HI”, “L2 LOW”, “L3 HI”, “L3 LOW”, “L4 HI”, “L4 LOW”, “L5 HI”, “L5 LOW” for the desiredPriority property. Furthermore, the ScheduledRecording service MUST also support two additional convenience values corresponding to the highest and lowest priority within the ScheduledRecording service. These two additional convenience values are “HIGHEST” (which is equivalent to the highest ordered priority slot in the highest priority level “L1 HI”), and “LOWEST” (which is equivalent to the lowest priority slot within the lowest priority level “L<n> LOW” when n is the total number of priority slots supported by the ScheduledRecording service).

All of these additional convenience values behave just like a “<@id>” value. The primary benefit of the convenience values is that they can be used to specify a specific ordered priority slot without having to determine the @id of the existing recordSchedule currently assigned to that slot. Additionally, as with a “<@id>” value, the existing recordSchedule already assigned to that desired priority slot and those recordSchedule instances assigned to lower priority slots, are shifted to the next lower slot. However, all recordSchedule instances remain within their same priority level.

In the following examples, the ScheduledRecording service supports 3 priority levels and also supports ordered priority. The examples begin with the following recordSchedule priorities already assigned.

**Table 2-47: Existing recordSchedule Priorities**

<table>
<thead>
<tr>
<th>Priority Level</th>
<th>RecordScheduleID</th>
<th>Ordered Priority Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>“L1” (highest priority level)</td>
<td>RS-A</td>
<td>1</td>
</tr>
<tr>
<td>“L2”</td>
<td>RS-C</td>
<td>2</td>
</tr>
<tr>
<td>“L3” (lowest priority level)</td>
<td>RS-B</td>
<td>3</td>
</tr>
</tbody>
</table>

Then the CreateRecordSchedule() action is invoked with the desiredPriority property set to “RS-C”. After the action completes, a new recordSchedule is created with the @id property set to “RS-D”. The set of recordSchedule instances is now prioritized as follows:

**Table 2-48: desiredPriority Property Set to “RS-C”**

<table>
<thead>
<tr>
<th>Priority Level</th>
<th>RecordScheduleID</th>
<th>Ordered Priority Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>“L1” (highest priority level)</td>
<td>RS-A</td>
<td>1</td>
</tr>
<tr>
<td>“L2”</td>
<td>RS-D RS-C</td>
<td>2 3</td>
</tr>
<tr>
<td>“L3” (lowest priority level)</td>
<td>RS-B</td>
<td>4</td>
</tr>
</tbody>
</table>

Next the CreateRecordSchedule() action is invoked with the desiredPriority property set to “HIGHEST”, “L1 HI”, or “RS-A” (all values have the same effect). After the action completes, a new recordSchedule is created with the @id property set to “RS-E”. The set of recordSchedule instances is now prioritized as follows:

**Table 2-49: desiredPriority Property Set to “HIGHEST”, “L1 HI”, or “RS-A”**

<table>
<thead>
<tr>
<th>Priority Level</th>
<th>RecordScheduleID</th>
<th>Ordered Priority Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>“L1” (highest priority level)</td>
<td>RS-E RS-A</td>
<td>1 2</td>
</tr>
<tr>
<td>“L2”</td>
<td>RS-D RS-C</td>
<td>3 4</td>
</tr>
</tbody>
</table>
Now the `CreateRecordSchedule()` action is invoked with the `desiredPriority` property set to "LOWEST", "L3_LOW", or "RS-B" (all values have the same effect). After the action completes, a new `recordSchedule` is created with the `@id` property set to "RS-F". The set of `recordSchedule` instances is now prioritized as follows:

Table 2-50: `desiredPriority` Property Set to "LOWEST", "L3_LOW", or "RS-B"

<table>
<thead>
<tr>
<th>Priority Level</th>
<th>RecordScheduleID</th>
<th>Ordered Priority Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>“L3” (lowest priority level)</td>
<td>RS-B</td>
<td>5</td>
</tr>
</tbody>
</table>

Finally, the `CreateRecordSchedule()` action is invoked with the `desiredPriority` property set to "RS-C". After the action completes, a new `recordSchedule` is created with the `@id` property set to "RS-G". The set of `recordSchedule` instances is now prioritized as follows:

Table 2-51: `desiredPriority` Property Set to "RS-C"

<table>
<thead>
<tr>
<th>Priority Level</th>
<th>RecordScheduleID</th>
<th>Ordered Priority Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>“L3&quot; (lowest priority level)</td>
<td>RS-B</td>
<td>5</td>
</tr>
</tbody>
</table>

2.8.4 Sorting `recordSchedule` Instances Based on their Current Priority Settings

Control points can obtain the list of `recordSchedule` instances sorted either by their current priority level or by their ordered priority slot. In order to sort the list of `recordSchedule` instances by their current priority level (in descending order; that is: highest priority level `recordSchedule` instances listed first), control points can invoke the `BrowseRecordSchedules()` action with the `SortCriteria` argument set to “+srs:priority”. In order to sort the list of `recordSchedule` instances sorted by their current ordered priority slot number (in descending order with the lowest ordered priority slot; that is: the highest slot number listed first), the control point can invoke the `BrowseRecordSchedules()` action with the `SortCriteria` argument set to “-srs:priority@OrderedValue”.

2.9 Theory of Operation

2.9.1 Introduction
The following sections walk through several scenarios to illustrate the various actions supported by the ScheduledRecording service. It should be noted that these scenarios are for example purposes only and do not have any normative value. Vendors may combine the described components in a variety of ways.

NOTE: For easy readability, the srs XML Documents of the examples presented below are shown before XML-escaping to improve readability. However, they need to be escaped before embedding in a SOAP message. Also, a shorthand notation method is used to describe the actions. The SOAP envelope is omitted in the examples and replaced by a shorthand notation.

2.9.2 Checking the Capabilities of a ScheduledRecording Service
The following examples illustrate how to check the capabilities of the ScheduledRecording service by using the GetSortCapabilities(), GetPropertyList(), and GetAllowedValues() actions.

2.9.2.1 Checking the Sort Capabilities
Assume that the ScheduledRecording service supports sorting on title, scheduledStartDateTime, and priority only. Then the request:

Request:
GetSortCapabilities()

will result in the following response:

Response:
GetSortCapabilities("srs:title,srs:scheduledStartDateTime,srs:priority")

2.9.2.2 Checking Supported Properties and their Allowed Values
A number of properties are OPTIONAL and therefore, vendors are free to decide whether or not to support those properties for their particular ScheduledRecording implementations. The GetPropertyList() and GetAllowedValues() actions provide the means for a control point to determine which properties a particular ScheduledRecording service supports (GetPropertyList() action) and also what the allowed values are for these properties (GetAllowedValues() action). Since the set of supported properties and their allowed values may depend on the context within which these properties are used, the GetPropertyList() and GetAllowedValues() actions allow the control point to specify the property-set data type for which the control point wants to retrieve support level information.

2.9.2.2.1 Minimal Implementation Example
As a first example, assume that this particular ScheduledRecording service is a truly minimal implementation (only the object.recordSchedule.direct.cdsNonEPG class is supported and only required properties are supported).

Assume further that the control point wants to determine which properties it can specify in the Elements input argument of the CreateRecordSchedule() action of this minimal ScheduledRecording implementation. It first issues the following request (The Elements input argument of the CreateRecordSchedule() action is of data type A_ARG_TYPE_RecordScheduleParts):

Note: This A_ARG_TYPE_RecordScheduleParts example is marked by a white background for better reader orientation.
Request:
GetPropertyList("A_ARG_TYPE_RecordScheduleParts")

Then the following response will be generated:

Response:
GetPropertyList(
  "srs:@id,srs:title,srs:class,srs:scheduledCDSObjectID,
   srs:scheduledStartDateTime,srs:scheduledDuration"
)

If the control point then wants to investigate further what values it may use for those properties when building a recordSchedule, it can retrieve that information using the following request:

Note: specifying “*::*” in the Filter argument is equivalent to specifying the complete list of property names that was returned in the PropertyList argument of the GetPropertyList action with the DataTypeID argument set to “A_ARG_TYPE_RecordScheduleParts”.

Request:
GetAllowedValues("A_ARG_TYPE_RecordScheduleParts", "*::*")

The following response will be generated:

Response:
GetAllowedValues("<?xml version="1.0" encoding="UTF-8"?>
<AVDT
 xmlns:xsd="http://www.w3.org/2001/XMLSchema"
 xmlns:srs="urn:schemas-upnp-org:av:srs"
 xmlns="urn:schemas-upnp-org:av:avdt"
 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 xsi:schemaLocation="urn:schemas-upnp-org:srs http://www.upnp.org/schemas/av/srs.xsd
 urn:schemas-upnp-org:av:avdt http://www.upnp.org/schemas/av/avdt.xsd">
  <contextID>
    <uid:device-UUID::urn:schemas-upnp-org:service:ScheduledRecording:1
  </contextID>
  <dataStructType>A_ARG_TYPE_RecordScheduleParts</dataStructType>
  
  <fieldTable>
    <field>
      <name>srs:@id</name>
      <dataType>xsd:string</dataType>
      <minCountTotal>1</minCountTotal>
      <allowedValueDescriptor>
        <allowAny/>
      </allowedValueDescriptor>
    </field>

    <field>
      <name>srs:title</name>
      <dataType>xsd:string</dataType>
      <minCountTotal>1</minCountTotal>
      <allowedValueDescriptor>
        <allowAny/>
      </allowedValueDescriptor>
    </field>

  </fieldTable>
</AVDT>"
Assume further that the control point wants to determine which properties it can expect to get returned in the `Result` output argument of the `CreateRecordSchedule()` action of that same minimal `ScheduledRecording` implementation. It issues the following request (The `Result` argument of the `CreateRecordSchedule()` action is of data type `A_ARG_TYPE_RecordSchedule`):

**Request:**
`GetPropertyList("A_ARG_TYPE_RecordSchedule")`

The following response will be generated:

**Response:**
`GetPropertyList("A_ARG_TYPE_RecordSchedule")`
If the control point then wants to investigate further what values it may expect for some of those properties when browsing a recordSchedule, it can retrieve that information using the following request (the Filter argument contains only a subset of the possible properties in this example):

Note: specifying "*: *" in the Filter argument is again equivalent to specifying the complete list of properties returned in the PropertyList argument of the GetPropertyList() action with the DataTypeID argument set to "A_ARG_TYPE_RecordSchedule".

Request:
GetAllowedValues("A_ARG_TYPE_RecordSchedule",
"srs:recordDestination,srs:recordDestination@mediaType,
srs:scheduleState,srs:scheduleState@currentErrors,
srs:abnormalTasksExist,srs:currentRecordTaskCount")

The following response will be generated:

Response:
GetAllowedValues("<?xml version="1.0" encoding="UTF-8"?>
<AVDT xmlns:xsd="http://www.w3.org/2001/XMLSchema"

    </allowedValueDescriptor>
  </field>
  <field>
    <name>srs:recordDestination@mediaType</name>
    <dataType>xsd:string</dataType>
  </field>
</fieldTable>
Assume further that the control point wants to determine which properties it can expect to get returned in the Result output argument of the GetRecordTask() action of that same minimal ScheduledRecording implementation. It issues the following request (The Result argument of the GetRecordTask() action is of data type A_ARG_TYPE_RecordTask):

**Request:**
GetPropertyList("A_ARG_TYPE_RecordTask")

The following response will be generated:

**Response:**
GetPropertyList("srs:@id,srs:title,srs:class,srs:priority,
  srs:recordDestination,srs:recordDestination@mediaType,
  srs:recordDestination@preference,
  srs:recordScheduleID,

2.9.2.2 Full-fledged Implementation Example

In this example, it is assumed that this particular ScheduledRecording service supports all optional functionality, offered by the ScheduledRecording service specification.

Assume that the control point wants to determine which properties it can specify in the Elements input argument of the CreateRecordSchedule() action of this full-fledged ScheduledRecording implementation. It issues the following request (The Elements input argument of the CreateRecordSchedule() action is of data type A_ARG_TYPE_RecordScheduleParts):

Note: This A_ARG_TYPE_RecordScheduleParts example is marked by a white background for better reader orientation.

**Request:**
GetPropertyList("A_ARG_TYPE_RecordScheduleParts")

Then the following response will be generated:

**Response:**
GetPropertyList("srs:@id, srs:title, srs:class, srs:desiredPriority, srs:desiredPriority@type, srs:recordDestination, srs:recordDestination@mediaType, srs:recordDestination@targetURL, srs:recordDestination@preference, srs:desiredRecordQuality, srs:desiredRecordQuality@type, srs:scheduledCDSObjectID, srs:scheduledChannelID, srs:scheduledChannelID@type, srs:scheduledDateTime, srs:scheduledDuration, srs:scheduledProgramCode, srs:scheduledProgramCode@type, srs:matchingName, srs:matchingName@type, srs:matchingName@substringMatch, srs:matchingID, srs:matchingID@type, srs:matchingChannelID, srs:matchingChannelID@type")

© 2013, UPnP Forum. All rights Reserved.
If the control point then wants to investigate further what values it may use when building a
recordSchedule, it can retrieve that information using the following request:

Request:
GetAllowedValues("A_ARG_TYPE_RecordScheduleParts", "*:*")

The following response will be generated:

Response:
See Appendix G.3, “A_ARG_TYPE_RecordScheduleParts AVDT Example” for a complete response
message.

Assume further that the control point wants to determine which properties it can expect to get returned in the
Result output argument of the CreateRecordSchedule() action of that same full-fledged
ScheduledRecording implementation. It issues the following request (The Result output argument of the
CreateRecordSchedule() action is of data type A_ARG_TYPE_RecordSchedule):

Note: This A_ARG_TYPE_RecordSchedule example is marked by a grey background for better reader
orientation.

Request:
GetPropertyList("A_ARG_TYPE_RecordSchedule")

The following response will be generated:

Response:
GetPropertyList(
"srs:@id, 
srs:title, 
srs:class, 
srs:additionalStatusInfo, 
srs:cdsReference, 
srs:cdsReference@link, 
srs:priority, 
srs:priority@orderedValue, 
srs:desiredPriority, 
srs:desiredPriority@type, 
srs:recordDestination, 
srs:recordDestination@mediaType, 
srs:recordDestination@targetURL, 
srs:recordDestination@preference,
...
If the control point then wants to investigate further what values it may expect for all of those properties when browsing a recordSchedule, it can retrieve that information using the following (The Result output argument of the CreateRecordSchedule() action is of data type A_ARG_TYPE_RecordSchedule):

Request:
GetAllowedValues("A_ARG_TYPE_RecordSchedule", "*:*")

The following response will be generated:

Response:
See Appendix G.1, “A_ARG_TYPE_RecordSchedule AVDT Example” for a complete response message.

Assume further that the control point wants to determine which properties it can expect to get returned in the Result output argument of the BrowseRecordTasks() action of that same full-fledged ScheduledRecording implementation. It issues the following request (The Result output argument of the BrowseRecordTasks() action is of data type A_ARG_TYPE_RecordTask):
Note: This A_ARG_TYPE_RecordTask example is marked by a light turquoise background for better reader orientation.

**Request:**
GetPropertyList("A_ARG_TYPE_RecordTask")

The following response will be generated:

**Response:**
GetPropertyList(

If the control point then wants to investigate further what values it may expect for all of those properties when browsing a recordTask, it can retrieve that information using the following (The Result output argument of the BrowseRecordTasks() action is of data type A_ARG_TYPE_RecordTask):

Request:
GetAllowedValues("A_ARG_TYPE_RecordTask", "*:*")

The following response will be generated:

Response:
See Appendix G.2, “A_ARG_TYPE_RecordTask AVDT Example” for a complete response message.

2.9.3 Adding a Scheduled Recording Entry to the List

The following examples illustrate how to create a recordSchedule entry in the list of recordSchedule instances by invoking the CreateRecordSchedule() action, using the different available recordSchedule classes. It is assumed that the implementation used in the examples that follow supports the allowed values for the desiredRecordQuality and desiredRecordQuality@type properties as indicated in Table B-9, “desiredRecordQuality Example” and for the recordQuality and recordQuality@type properties as indicated in Table B-33, “recordQuality Example”.

2.9.3.1 object.recordSchedule.direct classes

The object.recordSchedule.direct classes are used when the control point has all the necessary information available to uniquely identify the content to be recorded. The ScheduledRecording service does not have to perform searches or matching to determine what content is eligible for recording. Note that the control point might need to interact with external databases (like EPG information) to allow the user to make a selection of the content that he wants to record. Once the content is selected however, all information is available to set up the recordSchedule unambiguously.

2.9.3.1.1 Creating a object.recordSchedule.direct.manual Class recordSchedule

The object.recordSchedule.direct.manual class is used when the control point has access to the three basic components of information that are needed to uniquely identify the content to record:

- The scheduled channel that is used for broadcast of the content (where)
- The scheduled start date and time of the recording (when)
- The scheduled duration of the recording (how long)

It is assumed that the control point has some out-of-band means to retrieve this information. It passes this information into the recordSchedule using the REQUIRED properties scheduledChannelID and scheduledChannelID@type, scheduledStartDateDateTime, and scheduledDuration.

The control point creates a properly escaped srs XML Document that MUST contain all the REQUIRED properties necessary to create the object.recordSchedule.direct.manual class recordSchedule. The control point can add any OPTIONAL property that is applicable to the object.recordSchedule.direct.manual class.

As an example, the control point wants to create a recurring recordSchedule to record the BBC news that is broadcast for one hour every evening at 7 pm on channel 47. Assume that the current date&time is
Tuesday, June 28, 2005, 9:15 pm. If possible, the control point would like this recording to be stored on the internal hard disk, but if, for some reason, the hard disk is not available at the time of recording, the DVD+R drive may also be used as a secondary destination. The control point further specifies that this recording should be encoded using a low record quality setting of standard definition (“SD”). If that is not possible, any other record quality may be used (“AUTO”). A pre-roll time of two and a half minutes and a post-roll time of five minutes are also specified. The control point further instructs the ScheduledRecording service to keep at least the latest three recordings around. Older recordings may be discarded and no preallocation is desired.

To achieve the behavior specified above, the control point needs to provide the following srs XML Document in the Elements input argument of the CreateRecordSchedule() action:

Request:
CreateRecordSchedule("?

If the creation of the recordSchedule is successful, the CreateRecordSchedule() action returns the following srs XML Document in the Result output argument. The ScheduledRecording service MUST add unspecified supported OPTIONAL properties to convey default settings (Note that this srs XML Document MUST be properly escaped). One or more recordTask instances may be created as a result of the recordSchedule creation. In this example, it is assumed that 2 recordTask instances are spawned.
immediately and it is also assumed that 2 new items are created in the associated ContentDirectory service that will hold the recorded content once the recordings are made (object IDs “rec00001” and “rec00002” are assigned).

Response:
CreateRecordSchedule("s101","
<?xml version="1.0" encoding="UTF-8"?>
<srs
 xmlns="urn:schemas-upnp-org:av:srs"
 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 xsi:schemaLocation="
 urn:schemas-upnp-org:av:srs
 http://www.upnp.org/schemas/av/srs.xsd">
 <item id="s101">
<title>BBC News at 7pm</title>
<class>OBJECT.RECRODSCHEDULE.DIRECT.MANUAL</class>
<priority>L2</priority>
<desiredPriority type="PREDEF">L2</desiredPriority>
<recordDestination mediaType="HDD" preference="1">
 Hard Disk
</recordDestination>
<recordDestination mediaType="DVD+R" preference="2">
 DVD Recorder
</recordDestination>
<desiredRecordQuality type="DEFAULT">
 SD,AUTO
</desiredRecordQuality>
<scheduledChannelID type="ANALOG">47</scheduledChannelID>
<scheduledStartDateTime>T19:00:00</scheduledStartDateTime>
<scheduledDuration>P01:00:00</scheduledDuration>
<totalDesiredRecordTasks>0</totalDesiredRecordTasks>
<scheduledStartDateDateTimeAdjust>-P00:02:30</scheduledStartDateDateTimeAdjust>
<scheduledDurationAdjust>+P00:05:00</scheduledDurationAdjust>
<activePeriod>NOW/INFINITY</activePeriod>
<persistedRecordings latest="1" preAllocation="0" storedLifetime="ANY">
  3
</persistedRecordings>
<scheduleState currentErrors="">
 OPERATIONAL
</scheduleState>
<abnormalTasksExist>0</abnormalTasksExist>
<currentRecordTaskCount>2</currentRecordTaskCount>
<totalCreatedRecordTasks>2</totalCreatedRecordTasks>
<totalCompletedRecordTasks>0</totalCompletedRecordTasks>
</item>
</srs>"

As another example, assume that the user is currently watching the news program on channel 47, which started 10 minutes ago at 7:00 pm, and decides he/she wants to record this program from the beginning. This use case is enabled by the fact that the device has a buffer onboard which allows transitory content to be temporarily preserved for recording. The ContentDirectory service implementation on the device
indicates that the preservation of the content on channel 47 started at 6:45 pm (via the upnp:preservedTimeRange@starTime property). For recording the entire program from the beginning, the control point sets the scheduled start time to 7:00 pm and chooses a duration which likely includes the end of the news program (for example 30 minutes, starting from 7:00 pm). No pre-roll and post-roll times are specified. The desired destination is the internal hard disk. Any recording quality may be used. To achieve this behavior, the control point needs to provide the following srs XML Document in the Elements input argument of the CreateRecordSchedule() action:

Request:
CreateRecordSchedule("<?xml version="1.0" encoding="UTF-8"?>
  <item id="">
    <title>BBC News at 7pm</title>
    <class>OBJECT.RECORDSCHEDULE.DIRECT.MANUAL</class>
    <desiredPriority type="PREDEF">L2</desiredPriority>
    <recordDestination mediaType="HDD" preference="1">
      Hard Disk
    </recordDestination>
    <desiredRecordQuality type="DEFAULT">
      AUTO
    </desiredRecordQuality>
    <scheduledChannelID type="ANALOG">47</scheduledChannelID>
    <scheduledStartDateTime>
      2005-06-28T19:00:00
    </scheduledStartDateTime>
    <scheduledDuration>P00:30:00</scheduledDuration>
    <totalDesiredRecordTasks>1</totalDesiredRecordTasks>
    <activePeriod>PAST/INFINITY</activePeriod>
  </item>
</srs>")

Response:
CreateRecordSchedule("s101","<?xml version="1.0" encoding="UTF-8"?>
  <item id="s101">
    <title>BBC News at 7pm</title>
    <class>OBJECT.RECORDSCHEDULE.DIRECT.MANUAL</class>
    <priority>L2</priority>
    <desiredPriority type="PREDEF">L2</desiredPriority>
    <recordDestination mediaType="HDD" preference="1">
      Hard Disk
    </recordDestination>
  </item>
</srs>")

Note that the value of the activePeriod property of “PAST/INFINITY” is used in this case, since the actualScheduledStartDate of the scheduled recording is conceptually in the past. If the creation of the recordSchedule is successful, the CreateRecordSchedule() action returns the following srs XML Document in the Result output argument. One recordTask instance is spawned immediately.
If there is a gap in the channel’s preserved content in the specified recording time range, for instance because the user tuned away to another channel for a while, then this can be detected by the control point by the presence of the upnp:preservedTimeRange@endTime property. If the control point still decides to create a recordSchedule with a recording time range that encompasses multiple disjoint preserved content segments, then the recording behavior is vendor specified. Examples are: return an error, record the first segment, record the last segment, or record all segments. The control point can examine the created recordSchedule and recordTask(s) to determine how the device responded. Control points that want to record all the preserved segments may also create a separate recordSchedule for each segment.

2.9.3.1.2 Creating a object.recordSchedule.direct.cdsEPG Class recordSchedule

The object.recordSchedule.direct.cdsEPG class is used when the control point has access to a local ContentDirectory service EPG database. The content to be recorded is uniquely identified by an EPG item in the associated ContentDirectory service. The association between a ContentDirectory service and a ScheduledRecording service is established by having both services reside within the same UPnP MediaServer device.

In this case, the basic component of information that is needed to uniquely identify the content to record is the object ID of the EPG item (contains the where, when and how long information) that represents that content. The control point passes this information into the recordSchedule using the REQUIRED scheduledCDSObjectID property.

The control point creates a properly escaped srs XML Document that MUST contain all the REQUIRED properties necessary to create the object.recordSchedule.direct.cdsEPG class recordSchedule. The control point can add any OPTIONAL property that is applicable to the object.recordSchedule.direct.cdsEPG class.

As an example, the control point wants to create a recordSchedule to record the “UPnP Awards Ceremony” that is broadcast for a marathon fifteen hours on April 1st, at 9 am on channel 215. It finds this program in the EPG database of the associated ContentDirectory service and retrieves the object ID (value of the didl-lite:@id property of the EPG item). Due to the length of the program, the recording must be stored on the internal hard disk. If, for some reason, the hard disk is not available at the time of recording, the recording must be canceled. Further, if the recording would last longer than the anticipated 15 hours, the recording must be limited to 15 hours and the first part of the program discarded. The control point also specifies that this recording should be encoded using a low record quality setting of “Q3”. If that is not possible, the recording will not be made. A pre-roll time of two minutes and a post-roll
time of 15 minutes are also specified. The control point further instruct the ScheduledRecording service to keep track of this item in case the broadcaster decides to move it to a different channel and/or time.

To achieve the behavior specified above, the control point needs to provide the following *srs XML Document* in the **Elements** input argument of the CreateRecordSchedule() action:

**Request:**
CreateRecordSchedule(""
<?xml version="1.0" encoding="UTF-8"?>
<srs
xmlns="urn:schemas-upnp-org:av:srs"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="
urn:schemas-upnp-org:av:srs
http://www.upnp.org/schemas/av/srs.xsd">
<item id="">
<title>UPnP Awards Ceremony</title>
<class>OBJECT.RECORDSCHEDULE.DIRECT.CDSEPG</class>
<desiredPriority type="PREDEF">L1</desiredPriority>
<recordDestination mediaType="HDD" preference="1">
Hard Disk
</recordDestination>
<desiredRecordQuality type="QLEVEL">
Q3
</desiredRecordQuality>
<scheduledCDSObjectID>
egp_2005-04-01T09:00:00_P15:00:00
</scheduledCDSObjectID>
<totalDesiredRecordTasks>1</totalDesiredRecordTasks>
<scheduledStartDateTimeAdjust>
-P00:02:00
</scheduledStartDateTimeAdjust>
<scheduledDurationAdjust>
+P00:15:00
</scheduledDurationAdjust>
<activePeriod>NOW/INFINITY</activePeriod>
<durationLimit effect="LAST">P15:00:00</durationLimit>
<channelMigration>1</channelMigration>
<timeMigration>1</timeMigration>
<persistedRecordings
latest="1"
preAllocation="0"
storedLifetime="ANY">
1
</persistedRecordings>
</item>
</srs>"

If the creation of the recordSchedule is successful, the CreateRecordSchedule() action returns the following *srs XML Document* in the Result output argument. The ScheduledRecording service MUST add unspecified supported OPTIONAL properties to convey default settings (Note that this *srs XML Document* MUST be properly escaped). One recordTask instance may be created as a result of the recordSchedule creation. In this example, it is assumed that the recordTask instance is spawned immediately.

**Response:**
CreateRecordSchedule("s102",
<?xml version="1.0" encoding="UTF-8"?>
<srs
xmlns="urn:schemas-upnp-org:av:srs"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
As another example, the control point wants to record the program “The Best of UPnP”, which started in the past at 8:30 am. The device is capable of temporarily preserving the program content and indicates that this program has been preserved from the beginning (via the `upnp:programPreserved` property). The control point then knows that it can expect the entire program to be recorded, even though the record schedule is created past the program’s scheduled start time. To indicate that it wants to record the entire program, the control point needs to provide the following `srs` XML Document in the `Elements` input argument of the `CreateRecordSchedule()` action:

**Request:**
CreateRecordSchedule("  
<?xml version="1.0" encoding="UTF-8"?>  
<rs  
 xmlns="urn:schemas-upnp-org:av:rs"  
 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"  
 xsi:schemaLocation="
 urn:schemas-upnp-org:av:rs  
 http://www.upnp.org/schemas/av/srs.xsd">  
 <item id="s102">  
  <title>UPnP Awards Ceremony</title>  
  <class>OBJECT.RECORDSCHEDULE.DIRECT.CDSEPG</class>  
  <priority>L1</priority>  
  <desiredPriority type="PREF">L1</desiredPriority>  
  <recordDestination mediaType="HDD" preference="1">  
   Hard Disk  
  </recordDestination>  
  <desiredRecordQuality type="QLEVEL">  
   Q3  
  </desiredRecordQuality>  
  <scheduledCDSObjectID>  
   epg_2005-04-01T09:00:00_P15:00:00  
  </scheduledCDSObjectID>  
  <totalDesiredRecordTasks>1</totalDesiredRecordTasks>  
  <scheduledStartTimeAdjust>  
   -P00:02:00  
  </scheduledStartTimeAdjust>  
  <scheduledDurationAdjust>  
   +P00:15:00  
  </scheduledDurationAdjust>  
  <activePeriod>NOW/INFINITY</activePeriod>  
  <durationLimit effect="LAST">P15:00:00</durationLimit>  
  <channelMigration>1</channelMigration>  
  <timeMigration>1</timeMigration>  
  <persistedRecordings  
   latest="1"  
   preAllocation="0"  
   storedLifetime="ANY">  
   1  
  </persistedRecordings>  
  <scheduleState  
   currentErrors=""  
   OPERATIONAL  
  </scheduleState>  
  <abnormalTasksExist>0</abnormalTasksExist>  
  <currentRecordTaskCount>1</currentRecordTaskCount>  
  <totalCreatedRecordTasks>1</totalCreatedRecordTasks>  
  <totalCompletedRecordTasks>0</totalCompletedRecordTasks>  
 </item>  
</srs>"
If the creation of the `recordSchedule` is successful, the `CreateRecordSchedule()` action returns the following `srs XML Document` in the `Result` output argument. One `recordTask` instance may be created as a result of the `recordSchedule` creation. In this example, it is assumed that the `recordTask` instance is spawned immediately.

**Response:**

```xml
CreateRecordSchedule("s103","<?xml version="1.0" encoding="UTF-8"?><srs xmlns="urn:schemas-upnp-org:av:srs" xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance" xsi:schemaLocation="urn:schemas-upnp-org:av:srs http://www.upnp.org/schemas/av/srs.xsd"><item id="s103"><title>UPnP Awards Ceremony</title><class>OBJECT.RECORDSCHEDULE.DIRECT.CDSEPG</class><desiredPriority type="PREDEF">L1</desiredPriority><recordDestination mediaType="HDD" preference="1">Hard Disk</recordDestination><desiredRecordQuality type="QLEVEL">Q3</desiredRecordQuality><scheduledCDSObjectID>epg_2005-04-01T08:30:00_P00:30:00</scheduledCDSObjectID><totalDesiredRecordTasks>1</totalDesiredRecordTasks><activePeriod>PAST/INFINITY</activePeriod><scheduleState currentErrors="">OPERATIONAL</scheduleState><abnormalTasksExist>0</abnormalTasksExist><currentRecordTaskCount>1</currentRecordTaskCount><totalCreatedRecordTasks>1</totalCreatedRecordTasks><totalCompletedRecordTasks>0</totalCompletedRecordTasks></item></srs>
```

© 2013, UPnP Forum. All rights Reserved.
2.9.3.1.3 Creating a `object.recordSchedule.direct.cdsNonEPG` Class `recordSchedule`

The `object.recordSchedule.direct.cdsNonEPG` class is used when the control point has access to a local ContentDirectory service database that contains items that identify content that will be available for recording at the time the recording is scheduled to start.

A typical example of this is TV tuner that is represented as a `channelGroup` container, containing items of class `object.item.videoItem.videoBroadcast`, each representing a channel to which the tuner can be tuned (User Channel). The association between a ContentDirectory service and a ScheduledRecording service is established by having both services reside within the same UPnP MediaServer device.

In this case, the basic components of information that are needed to uniquely identify the content to record are:

- The object ID of the ContentDirectory service item that represents the User Channel that is used for broadcast of the content (`where`)
- The scheduled start date and time of the recording (`when`)
- The scheduled duration of the recording (`how long`)

It is assumed that the control point has some out-of-band means to retrieve this information. It passes this information into the `recordSchedule` using the REQUIRED properties `scheduledCDSObjectID`, `scheduledStartDateDateTime`, and `scheduledDuration`.

The control point creates a properly escaped `srs XML Document` that MUST contain all the REQUIRED properties necessary to create the `object.recordSchedule.direct.cdsNonEPG` class `recordSchedule`. The control point can add any OPTIONAL property that is applicable to the `object.recordSchedule.direct.cdsNonEPG` class.

As an example, assume that today’s date is Tuesday, June 28, 2005 and the control point wants to create a `recordSchedule` to record the show “Life of a Software Developer” that is broadcast on channel 5 every Monday evening at 7 pm, starting on July 4th. The show lasts for an hour and runs for 13 episodes (until the end of September). The first fifteen minutes of each show are dedicated to a reading of the “Most Popular Software Code Quote of the Week”. The user found all this information in a printed TV Guide. The ContentDirectory service has no EPG data.

The control point finds the User Channel that represents channel 5 in the associated ContentDirectory service and retrieves its object ID (value of the `didl-lite:@id` property of the User Channel item). The recording should be stored on the internal hard disk. If, for some reason, the hard disk is not available at the time of recording, the recording might also be recorded on an external network storage device. All episodes (13) of the show should be recorded. The control point also specifies that this recording should be encoded using a high record quality setting of High Definition (“HD”). The “Most Popular Software Code Quote of the Week” part of the show must be skipped but a pre-roll time of two minutes and a post-roll time of three minutes are also specified. All episodes must be preserved until deleted by the user.

To achieve the behavior specified above, the control point needs to provide the following `srs XML Document` in the `Elements` input argument of the `CreateRecordSchedule()` action:

**Request:**

```xml
<?xml version="1.0" encoding="UTF-8"?>
<sr
 xmlns="urn:schemas-upnp-org:av:srs"
 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 xsi:schemaLocation="
 urn:schemas-upnp-org:av:srs
 http://www.upnp.org/schemas/av/srs.xsd"
```
If the creation of the recordSchedule is successful, the CreateRecordSchedule() action returns the following srs XML Document in the Result output argument. The ScheduledRecording service MUST add unspecified supported OPTIONAL properties to convey default settings (Note that this srs XML Document MUST be properly escaped). One or more recordTask instances may be created as a result of the recordSchedule creation. In this example, it is assumed that 2 recordTask instances are spawned immediately.

Response:
CreateRecordSchedule("s103","<?xml version="1.0" encoding="UTF-8"?>
<item id="s103">
<title>Life of a Software Developer</title>
<class>OBJECT.RECRODSCHEDULE.DIRECT.CDSNONEPG</class>
<desiredPriority type="PREDEF">L1</desiredPriority>
<recordDestination mediaType="HDD" preference="1">Hard Disk</recordDestination>
<recordDestination mediaType="HDD" preference="2" targetURL="http://192.168.0.12/MyNAS/RecordedTV">Shared Content</recordDestination>
<desiredRecordQuality type="DEFAULT">HD</desiredRecordQuality>
<scheduledCDSObjectID>User_Channel_5</scheduledCDSObjectID>
<scheduledStartDateDateTime>MONT19:00:00</scheduledStartDateDateTime>
<scheduledDuration>00:01:00</scheduledDuration>
<totalDesiredRecordTasks>13</totalDesiredRecordTasks>
<scheduledStartDateDateTimeAdjust>+P00:13:00</scheduledStartDateDateTimeAdjust>
<scheduledDurationAdjust>+P00:03:00</scheduledDurationAdjust>
<activePeriod>NOW/09-30T23:59:59</activePeriod>
<persistedRecordings latest="1" preAllocation="0" storedLifetime="INFINITY">
13
</persistedRecordings>
</item>
</srs>"
2.9.3.1.4 Creating a `object.recordSchedule.direct.programCode` Class `recordSchedule`

The `object.recordSchedule.direct.programCode` class is used when the control point has access (via the user, most likely) to a program code. The content to be recorded is uniquely identified by this program code in the sense that the program code contains all necessary information for recording the program item (where, when and how long). If the ScheduledRecording service supports a particular program code type, that implies that the ScheduledRecording service must understand how to interpret and decode the program code into its where, when and how long components.

In this case, the basic component of information that is needed to uniquely identify the content to record is the program code of the program item that represents that content. The control point passes this information into the `recordSchedule` using the REQUIRED properties `scheduledProgramCode` and `scheduledProgramCode@type`.

The control point creates a properly escaped `srs XML Document` that MUST contain all the REQUIRED properties necessary to create the `object.recordSchedule.direct.programCode` class `recordSchedule`. The
control point can add any **OPTIONAL** property that is applicable to the _object_, `recordSchedule.direct.programCode` class.

As a hypothetical example, the control point wants to create a `recordSchedule` to record a program item, identified by a program code of type “upnpexample.com_upnpProgramCode” time. The upnpProgramCode type specifies the encoding to be simply:

```
program code = <channel number>_<StartDateTime>_<Duration>
```

The user retrieved the program code from some external source (a printed program guide) and the advertised title of the program is “Everything you ever wanted to know about SRS”.

It is assumed that the ScheduledRecording service supports the “upnpexample.com_upnpProgramCode” program code type and therefore knows how to decode the program code into its basic _where_, _when_ and _how long_ components. The recording must be stored on the internal DVD+RW drive. If, for some reason, the DVD+RW drive is not available at the time of recording, the recording must be stored on the internal hard disk. The control point also specifies that this recording should be recorded using any available record quality setting. No pre-roll or post-roll times are specified.

To achieve the behavior specified above, the control point needs to provide the following `srs XML Document` in the _Elements_ input argument of the `CreateRecordSchedule()` action:

**Request:**
```
Request:
CreateRecordSchedule("
<?xml version="1.0" encoding="UTF-8"?>
<srs
xmlns="urn:schemas-upnp-org:av:srs"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="
urn:schemas-upnp-org:av:srs
http://www.upnp.org/schemas/av/srs.xsd">
  <item id="">
    <title>About SRS</title>
    <class>OBJECT.RECORDSCHEDULE.DIRECT.PROGRAMCODE</class>
    <desiredPriority type="PREDEF">L1</desiredPriority>
    <recordDestination mediaType="DVD+RW" preference="1">
      DVD Drive
    </recordDestination>
    <recordDestination mediaType="HDD" preference="2">
      Hard Disk
    </recordDestination>
    <desiredRecordQuality type="DEFAULT">
      AUTO
    </desiredRecordQuality>
    <scheduledProgramCode type="upnpexample.org_upnpProgramCode">
      2005-07-01_09:00:00_00:30:00
    </scheduledProgramCode>
  </item>
</srs>
```

If the creation of the `recordSchedule` is successful, the `CreateRecordSchedule()` action returns the following `srs XML Document` in the _Result_ output argument. The ScheduledRecording service MUST add unspecified supported OPTIONAL properties to convey default settings (Note that this `srs XML Document` MUST be properly escaped). One `recordTask` instance may be created as a result of the `recordSchedule` creation. In this example, it is assumed that the `recordTask` instance is spawned immediately.

**Response:**
```
Response:
CreateRecordSchedule("s104","
<?xml version="1.0" encoding="UTF-8"?>
```
2.9.3.2 object.recordSchedule.query classes

The object.recordSchedule.query classes are used when the control point only has partial information to identify possible candidates for recording. The ScheduledRecording service must perform further (continuous) searching or matching to determine what content is eligible for recording. The ScheduledRecording service must consult with external databases (like EPG information or over-the-wire Service Information) to find content that matches all the criteria, specified in the recordSchedule. Every time a match is found, a new recordTask is created.
2.9.3.2.1 Creating a object.recordSchedule.query.contentName Class recordSchedule

The object.recordSchedule.query.contentName class is used when the control point has knowledge about the (partial) name of the content to be recorded. This could either be a series name or a program name. Other properties, specified in the recordSchedule are also used to further narrow down what will be recorded (activePeriod, totalDesiredRecordTasks, etc.). It is the responsibility of the ScheduledRecording service to continuously search available external databases (like EPG or Service Information) and create a recordTask instance for every complete match (all specified matching criteria are satisfied) it finds within those external databases.

In this case, the basic piece of information that is needed to identify the content to record is the (partial) program or series name of the program item or series. The control point passes this information into the recordSchedule using the REQUIRED properties matchingName and matchingName@type.

The control point creates a properly escaped srs XML Document that MUST contain all the REQUIRED properties necessary to create the object.recordSchedule.query.contentName class recordSchedule. The control point can add any OPTIONAL property that is applicable to the object.recordSchedule.query.contentName class.

As an example, the control point wants to create a recordSchedule to record the series entitled “Meet the UPnP Guys” (exact title). The control point has no further information, except that the series is broadcast during summer season and the series finale is planned somewhere during the month of September.

The recordings must be stored on the internal Hard Disk. If, for some reason, the Hard Disk is not available at the time of recording, the recording must be canceled. The control point also specifies that these recordings should be encoded using a low record quality (“SD”). If that is not possible, medium record quality (“ED”) may also be used. If that is not possible, no recording will be made. No pre-roll or post-roll times are specified. If the broadcaster decides to change broadcast channel or date&time, the ScheduledRecording service is supposed to track.

To achieve the behavior specified above, the control point needs to provide the following srs XML Document in the Elements input argument of the CreateRecordSchedule() action:

```
Request:
CreateRecordSchedule("
<?xml version="1.0" encoding="UTF-8"?>
<srs
 xmlns="urn:schemas-upnp-org:av:srs"
 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 xsi:schemaLocation="
    urn:schemas-upnp-org:av:srs
    http://www.upnp.org/schemas/av/srs.xsd">
    <item id="">
        <title>Meet the UPnP Guys series</title>
        <class>OBJECT.RECORDSCHEDULE.QUERY.CONTENTNAME</class>
        <desiredPriority type="PREDEF">L1</desiredPriority>
        <recordDestination mediaType="HDD" preference="1">
            Hard Disk
        </recordDestination>
        <desiredRecordQuality type="DEFAULT">
            SD, ED
        </desiredRecordQuality>
        <matchingName type="SERIES" subStringMatch="0">Meet the UPnP Guys</matchingName>
        <matchingStartDateTimeRange>
            NOW/09-30T23:59:59
        </matchingStartDateTimeRange>
        <totalDesiredRecordTasks>0</totalDesiredRecordTasks>
        <channelMigration>1</channelMigration>
    </item>
</srs>
```
If the creation of the recordSchedule is successful, the CreateRecordSchedule() action returns the following srs XML Document in the Result output argument. The ScheduledRecording service MUST add unspecified supported OPTIONAL properties to convey default settings (Note that this srs XML Document MUST be properly escaped). One or more recordTask instances may be created as a result of the recordSchedule creation. In this example, it is assumed that one recordTask instance is spawned immediately (12 remaining matches need to be found in the future, when new EPG data is available, for instance).

Response:
CreateRecordSchedule("s201","
<?xml version="1.0" encoding="UTF-8"?>
<srs
 xmlns="urn:schemas-upnp-org:av:srs"
 xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
 xsi:schemaLocation="
 urn:schemas-upnp-org:av:srs
 http://www.upnp.org/schemas/av/srs.xsd">
 <item id="s201">
 <title>Meet the UPnP Guys series</title>
 <class>OBJECT.RECORDSCHEDULE.QUERY.CONTENTNAME</class>
 <priority>L1</priority>
 <desiredPriority type="PREDEF">L1</desiredPriority>
 <recordDestination mediaType="HDD" preference="1">Hard Disk</recordDestination>
 <desiredRecordQuality type="DEFAULT">SD, ED</desiredRecordQuality>
 <matchingName type="SERIES" subStringMatch="0">Meet the UPnP Guys</matchingName>
 <matchingStartDateTimeRange>
  NOW/09-30T23:59:59
 </matchingStartDateTimeRange>
 <totalDesiredRecordTasks>0</totalDesiredRecordTasks>
 <scheduledStartDateTimeAdjust>+P00:00:00</scheduledStartDateTimeAdjust>
 <scheduledDurationAdjust>+P00:00:00</scheduledDurationAdjust>
 <activePeriod>NOW/INFINITY</activePeriod>
 <durationLimit effect="LAST">INFINITY</durationLimit>
 <persistedRecordings latest="1" preAllocation="0" storedLifetime="ANY">
  0
 </persistedRecordings>
 <scheduleState currentErrors="">
  OPERATIONAL
 </scheduleState>
 <abnormalTasksExist>0</abnormalTasksExist>
 <currentRecordTaskCount>1</currentRecordTaskCount>
 </item>
</srs>"
2.9.3.2.2 Creating a object.recordSchedule.query.contentID Class recordSchedule

The object.recordSchedule.query.contentID class is used when the control point has knowledge about the ID of the content to be recorded. This could either be a series ID or a program ID. Other properties, specified in the recordSchedule are also used to further narrow down what will be recorded (activePeriod, totalDesiredRecordTasks, etc.). It is the responsibility of the ScheduledRecording service to continuously search available external databases (like EPG or Service Information) and create a recordTask instance for every complete match (all specified matching criteria are satisfied) it finds within those external databases.

In this case, the basic piece of information that is needed to identify the content to record is the program ID or series ID of the program item or series. The control point passes this information into the recordSchedule using the REQUIRED properties matchingID and matchingID@type.

The control point creates a properly escaped srs XML Document that MUST contain all the REQUIRED properties necessary to create the object.recordSchedule.query.contentID class recordSchedule. The control point can add any OPTIONAL property that is applicable to the object.recordSchedule.query.contentID class.

As an example, the control point wants to create a recordSchedule to record the program with program ID “123456” from service provider “MyLocalProvider.net”. It has obtained this ID through means outside the scope of this specification. The control point has no further information.

The recordings must be stored on the internal Hard Disk. If, for some reason, the Hard Disk is not available at the time of recording, the recording must be canceled. The control point also specifies that the recording should be encoded using a high record quality setting of “720p60”. If that is not possible, no recording will be made. No pre-roll or post-roll times are specified. If the broadcaster decides to change broadcast channel or date/time, the ScheduledRecording service is supposed to track.

To achieve the behavior specified above, the control point needs to provide the following srs XML Document in the Elements input argument of the CreateRecordSchedule() action:

Request:
CreateRecordSchedule("$
<?xml version="1.0" encoding="UTF-8"?>
<rs xmlns="urn:schemas-upnp-org:av:rs"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="
urn:schemas-upnp-org:av:rs
http://www.upnp.org/schemas/av/srs.xsd">
<item id="">
<title>My Program</title>
<class>OBJECT.RECORDSCHEDULE.QUERY.CONTENTID</class>
<desiredPriority type="PREDEF">L1</desiredPriority>
<recordDestination mediaType="HDD" preference="1">
Hard Disk
</recordDestination>
<desiredRecordQuality type="ATSC">
720p60
</desiredRecordQuality>
<matchingID type="MyLocalProvider.net">
123456
</matchingID>
<totalDesiredRecordTasks>1</totalDesiredRecordTasks>
<channelMigration>1</channelMigration>
</item>
</rs>"
If the creation of the recordSchedule is successful, the CreateRecordSchedule() action returns the following srs XML Document in the Result output argument. The ScheduledRecording service MUST add unspecified supported OPTIONAL properties to convey default settings (Note that this srs XML Document MUST be properly escaped). One recordTask instance may be created as a result of the recordSchedule creation. In this example, it is assumed that the recordTask instance is spawned immediately.

Response:
CreateRecordSchedule("s202","
<?xml version="1.0" encoding="UTF-8"?>
<srs
xmlns="urn:schemas-upnp-org:av:srs"
xmns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="urn:schemas-upnp-org:av:srs http://www.upnp.org/schemas/av/srs.xsd">
<item id="s202">
<title>My Program</title>

<scheduleState
currentErrors=""
OPERATIONAL
</scheduleState>
<abnormalTasksExist>0</abnormalTasksExist>
<currentRecordTaskCount>1</currentRecordTaskCount>
<totalCreatedRecordTasks>1</totalCreatedRecordTasks>
<totalCompletedRecordTasks>0</totalCompletedRecordTasks>
</item>
</srs>"
2.9.4 Deleting a recordSchedule

A control point can delete a particular recordSchedule by invoking the DeleteRecordSchedule() action and specifying its object ID in the RecordScheduleID argument.

Assume that the recordSchedule to be deleted has its @id property set to “s301”.

To delete this recordSchedule, the control point generates the following request:

Request:
DeleteRecordSchedule("s301")

Response:
---

2.9.5 Browsing recordSchedule and recordTask instances

A control point can investigate which recordSchedule and/or recordTask instances are currently present within a ScheduledRecording service implementation by invoking the BrowseRecordSchedules() and BrowseRecordTasks() actions.

For example purposes, it is assumed that the control point has invoked the CreateRecordSchedule() action once for each of the cases described in Sections 2.9.3.1.1 through 2.9.3.1.4 and Sections 2.9.3.2.1 and 2.9.3.2.2. As a result, six recordSchedule instances as specified in the sections above have been created. In addition, eight recordTask instances have been created so that the available recordSchedule and recordTask instances in this particular ScheduledRecording service implementation are as follows:

recordSchedule (@id = “s101”, class = “OBJECT.RECORDSCHEDULE.DIRECT.MANUAL”)
  recordTask (@id = “t101-001”, class = “OBJECT.RECORDTASK”)
  recordTask (@id = “t101-002”, class = “OBJECT.RECORDTASK”)
recordSchedule (@id = “s102”, class = “OBJECT.RECORDSCHEDULE.DIRECT.CDSEPG”)
  recordTask (@id = “t102-001”, class = “OBJECT.RECORDTASK”)
recordSchedule (@id = “s103”, class = “OBJECT.RECORDSCHEDULE.DIRECT.CDSNONEPG”)
  recordTask (@id = “t103-001”, class = “OBJECT.RECORDTASK”)
  recordTask (@id = “t103-002”, class = “OBJECT.RECORDTASK”)
recordSchedule (@id = “s104”, class = “OBJECT.RECORDSCHEDULE.DIRECT.PROGRAMCODE”)
  recordTask (@id = “t104-001”, class = “OBJECT.RECORDTASK”)
recordSchedule (@id = “s201”, class = “OBJECT.RECORDSCHEDULE.QUERY.CONTENTNAME”)
  recordTask (@id = “t201-001”, class = “OBJECT.RECORDTASK”)
recordSchedule (@id = “s202”, class = “OBJECT.RECORDSCHEDULE.QUERY.CONTENTID”)
  recordTask (@id = “t202-001”, class = “OBJECT.RECORDTASK”)

2.9.5.1 Browsing recordSchedule instances

When a control point wants to gather detailed information on currently existing recordSchedule instances, it can do this by invoking the BrowseRecordSchedules() action. The following request:

Request:
BrowseRecordSchedules("", 0, 10, "srs:title")

returns the following response (the result only returns the REQUIRED properties (Filter argument is set to “”) and is sorted according to the value of the title property):
Response:
BrowseRecordSchedules("  
<?xml version="1.0" encoding="UTF-8"?>  
<srs

 </item>  
</srs>"
2.9.5.2 Browsing recordTask instances associated with a single recordSchedule

When a control point wants to gather detailed information on currently existing recordTask instances that are associated with a particular recordSchedule, it can do this by invoking the BrowseRecordTasks() action.

As an example, assume that the control point wants to browse all recordTask instances, associated with the recordSchedule with its @id property set to “s101”. It wants to retrieve all supported properties (Filter argument set to “*:*”) and sorting is not important (SortCriteria argument set to “”).

The following request:

Request: BrowseRecordTasks("s101", "*:*", 0, 10, "")

returns the following response:

Response: BrowseRecordTasks(" 

<?xml version="1.0" encoding="UTF-8"?>
<rs xmlns="urn:schemas-upnp-org:av:srs"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"

2.9.6 Rating System

A ScheduledRecording service offers the OPTIONAL ability to impose rating limits on recordable content.

A ScheduledRecording service implementation may provide a list of supported ratings. The supported ratings can be retrieved by invoking the `GetAllowedValues()` action and specifying the `matchingRatingLimit` property in the `Filter` argument.

In the United States, TV manufacturers are REQUIRED to provide built-in support for the TV Parental Guidelines Monitoring Board rating system. (See http://www.tvguidelines.org.)

Motion picture content is rated on a voluntary basis by the Motion Picture Association of America. (See http://www.mpaa.org.)

Since it is not a simple matter to determine the rating system applicable to recordable content, the control point should provide values for all applicable rating systems when specifying a rating limit.

For example if the control point was configured to limit content for children, it may provide the following rating limit properties.

```xml
<matchingRatingLimit type="TVGUIDELINES.ORG">
  TV-G
</matchingRatingLimit>
<matchingRatingLimit type="MPAA.ORG">
  G
</matchingRatingLimit>
```

Since the intent of the rating limit is a limiting value, the ScheduledRecording service MUST exclude unrated content or content whose rating system does not match any of the rating types in the `matchingRatingLimit` properties provided by the control point.
Since rating limits are intended to preclude some (subset of) users from accessing content, it is up to the control point to identify users and apply the appropriate rating profile to individual users.

### 2.9.7 Conflict Detection and Resolution

Conflicts between recordTask instances arise when the recording events, associated with those recordTask instances, overlap in time and there are not enough resources available to record all of the requested recording events.

Conflict detection always happens at the recordTask level. It is possible that, at recordSchedule creation time, the ScheduledRecording service is not able to accurately indicate whether scheduling conflicts may arise in the future. Indeed, a ScheduledRecording service is not required or even capable (for a query-type recordSchedule) of generating all the recordTask instances that will ever be associated with the recordSchedule. Furthermore, a ScheduledRecording service implementation is allowed to either reject the creation of a recordSchedule that creates a scheduling conflict (the CreateRecordSchedule() action returns with error code 730, “Conflict”) or accept such a recordSchedule. A control point can therefore only rely on the occurrence of error code 401, “Conflicting Program Loser” or error code 402, “Conflicting Program Winner” in the taskstate@currentErrors property of all the recordTask instances to accurately determine whether scheduling conflicts exist. Note that the ScheduledRecording service always picks a Conflicting Program Winner, based upon priority settings and/or other vendor-defined criteria.

At this time, conflict resolution is not adequately supported by this specification. When one or more recordTask instances are conflicting, there is currently no straightforward way for a control point to change the Conflicting Program Winner. Instead, a control point may disable specific recordTask instances so that the intended recordTask becomes the Conflicting Program Winner. The drawback of this approach is that if the newly appointed Conflicting Program Winner changes over time (due to channel- or time migration, for instance), the disabled recordTask instances remain disabled and will not record, even if that would have become possible.

Alternatively, a control point may use the DeleteRecordSchedule() and CreateRecordSchedule() actions to reschedule the recordSchedule with a different priority level. The drawback of this approach is that all recordTask instances associated with the deleted recordSchedule are also deleted and any customization by the user that happened at the recordTask level will get lost as well.

A future version of this specification will address the conflict resolution issue in detail.

4 Test

No semantic tests have been specified for this service.
Appendix A.  **srs XML Document (Normative)**

This section describes the *srs XML Document* that is used in action arguments of the *property-set* data type. Any *srs XML Document* MUST conform to the SRS schema as defined in [SRS-XSD]. Each *srs XML Document* contains one of the following data types: **A_ARG_TYPE_RecordSchedule**, **A_ARG_TYPE_RecordTask** or **A_ARG_TYPE_RecordScheduleParts**. All *property-set* data types are based on properties in the srs namespace and are therefore based on the SRS schema.

Due to limitations of the XML Schema syntax, the SRS schema in itself is often not adequate to accurately describe the limitations and restrictions imposed by a particular ScheduledRecording service implementation. For example, the set of supported properties and their allowed values may vary among implementations.

To allow ScheduledRecording service implementations to indicate which properties and their allowed values they support, the concept of the AV Datastructure Template (AVDT) is introduced. A ScheduledRecording service implementation can provide very detailed information about supported properties and their allowed values by means of an *AVDT XML Document*. The *AVDT XML Document* MUST conform to the AVDT schema as defined in [AVDT].

An *AVDT XML Document* can be retrieved by invoking the `GetAllowedValues()` action. The `DataTypeID` input argument identifies the data structure to be described by the *AVDT XML Document*. Indeed, depending on the particular ScheduledRecording service implementation, the set of supported properties and their allowed values of a given *property-set* data type may vary. For example, the set of properties that can be specified in the `Elements` input argument (of data type **A_ARG_TYPE_RecordScheduleParts**) of the `CreateRecordSchedule()` action may differ substantially between implementations. Additionally, the set of properties supported by different data types will obviously vary as well.

At this time, this specification identifies three different *AVDT XML Document* manifestations, depending on the data type of the objects described in the *AVDT XML Document*:

- The **A_ARG_TYPE_RecordSchedule** AVDT XML Document
- The **A_ARG_TYPE_RecordTask** AVDT XML Document
- The **A_ARG_TYPE_RecordScheduleParts** AVDT XML Document

### A.1 **A_ARG_TYPE_RecordSchedule** AVDT XML Document

This type of *AVDT XML Document* is used to describe the data structure of a *recordSchedule* object for a particular ScheduledRecording service implementation. Examples of action arguments that use this data type include the `Result` output argument of the `BrowseRecordSchedules()` and `GetRecordSchedule()` actions.

When using the *AVDT XML Document* in this context, the following rules apply:

- The `<contextID>` field MUST be set to “uuid:device-UUID::urn:schemas-upnp-org:service:ScheduledRecording:1”.
- The `<dataStructType>` field MUST be set to “**A_ARG_TYPE_RecordSchedule**”.
- The `<fieldTable>` field MUST contain field elements for all the REQUIRED properties of all the `object.recordSchedule.xxx` classes supported by the service. Refer to Table C-2, “Class Properties Overview for `recordSchedule`”, `recordSchedule`-related columns.
- The `<fieldTable>` field MUST also contain field elements for all the supported OPTIONAL properties of all the `object.recordSchedule.xxx` classes implemented by the service. Refer to Table C-2, “Class Properties Overview for `recordSchedule`”, `recordSchedule`-related columns.

Field specific rules:
• There must be one and only one field with the subelement <name> set to “class”
• The allowed values for this field MUST only be derived from the object.recordSchedule virtual class.
• The <name> subelement of all <field> elements MUST only contain names of recordSchedule properties.

For a full-fledged example of a _A_ARG_TYPE_RecordSchedule AVDT XML Document_, see Appendix G.1, “_A_ARG_TYPE_RecordSchedule AVDT Example_

### A.2 _A_ARG_TYPE_RecordTask AVDT XML Document_

This type of AVDT XML Document is used to describe the data structure of a recordTask object for a particular ScheduledRecording service implementation. Examples of action arguments that use this data type include the Result output argument of the BrowseRecordTasks() and GetRecordTask() actions.

When using the AVDT XML Document in this context, the following rules apply:

• The <contextID> field MUST be set to “uuid:device-UUID::urn:schemas-upnp-org:service:ScheduledRecording:1”.
• The <dataStructType> field MUST be set to “_A_ARG_TYPE_RecordTask_”.
• The <fieldTable> field MUST contain field elements for all the REQUIRED properties of the object.recordTask class. Refer to Table C-2, “Class Properties Overview for recordSchedule”, recordTask-related column.
• The <fieldTable> field MUST also contain field elements for all the supported OPTIONAL properties of the object.recordTask class. Refer to Table C-2, “Class Properties Overview for recordSchedule”, recordTask-related column.

Field specific rules:

• There must be one and only one field with the subelement <name> set to “class”
• The allowed values for this field MUST only be derived from the object.recordTask class.
• The <name> subelement of all <field> elements MUST only contain names of recordTask properties.

For a full-fledged example of a _A_ARG_TYPE_RecordTask AVDT XML Document_, see Appendix G.2, “_A_ARG_TYPE_RecordTask AVDT Example_”.

### A.3 _A_ARG_TYPE_RecordScheduleParts AVDT XML Document_

This type of AVDT XML Document is used to describe the data structure of a recordScheduleParts object for a particular ScheduledRecording service implementation. Examples of action arguments that use this data type include the Elements input argument of the CreateRecordSchedule() action.

When using the AVDT XML Document in this context, the following rules apply:

• The <contextID> field MUST be set to “uuid:device-UUID::urn:schemas-upnp-org:service:ScheduledRecording:1”.
• The <dataStructType> field MUST be set to “_A_ARG_TYPE_RecordScheduleParts_”.
• The <fieldTable> field MUST contain field elements for all the REQUIRED properties of all the object.recordSchedule.xxx classes supported by the service. Refer to Table C-1, “Class Properties Overview”, recordSchedule-related columns.
The `<fieldTable>` field MUST also contain field elements for all the supported OPTIONAL properties of all the `object.recordSchedule.xxx` classes implemented by the service. Refer to Table C-1, “Class Properties Overview”, `recordSchedule`-related columns.

Field specific rules:

- There must be one and only one field with the subelement `<name>` set to “class”
- The allowed values for this field MUST only be derived from the `object.recordSchedule` virtual class.
- The `<name>` subelement of all `<field>` elements MUST only contain names of `recordSchedule` properties.

For a full-fledged example of a `A_ARG_TYPE_RecordScheduleParts` AVDT XML Document, see Appendix G.3, “`A_ARG_TYPE_RecordScheduleParts` AVDT Example”.

Appendix B. AV Working Committee Extended Properties (Normative)

The tables and sections below list all properties defined by the AV Working Committee. A property is expressed in XML as either an XML element or an XML attribute.

In the following sections, the definition of each property and its default value, if applicable, is described, followed by the specifics pertaining to INPUT and OUTPUT usage for this property. The INPUT usage indicates how the property is used in a recordScheduleParts object. The OUTPUT usage indicates how the property is used in a recordSchedule and/or recordTask object.

Note: The NS column in the tables contains the namespace prefix of the namespace to which the property name belongs. The M-Val column indicates whether the property is multi-valued (M-Val = YES) or single-valued (M-Val = NO). See Section 2.2.2.17, “Multi-valued property” and Section 2.2.2.18, “Single-valued property”.

B.1 Base Properties

</tr>
</tbody>
</table>

B.1.1 @id

Namespace: srs  
Property Data Type: xsd:string  
Multi-Valued: NO

Description: The @id property identifies a recordSchedule or recordTask object. The value MUST be unique in the ScheduledRecording service. The value MUST be set by the ScheduledRecording service.

Default Value: N/A – Required on input.

Sort Order: Lexical or Lexical Numeric.

Each implementation SHOULD use the sort method most appropriate for its method of generating @id values. If @id values contain a numeric (sub)string that contains values that increment with each new object creation, then use Lexical Numeric; otherwise, use Lexical.

Input: When creating a new recordSchedule object, the @id property MUST be specified to satisfy the SRS XML Schema and MUST be set to the empty string.

Output: The unique object ID set by the ScheduledRecording service.

B.1.2 title

Namespace: srs  
Property Data Type: xsd:string  
Multi-Valued: NO

© 2013, UPnP Forum. All rights Reserved.
Description: Primary title of the object. The title property contains a friendly name to identify the object. This property can be either user-supplied or derived from the content name the object represents. This property is not to be confused with the matchingName or matchedName property. See also http://dublincore.org/documents/dces.

Default Value: N/A – Required on input.

Sort Order: Lexical.

Input: The desired setting.

Output: The current setting.

B.1.3 class

Namespace: srs Property Data Type: xsd:string Multi-Valued: NO

Description: The class property identifies the class of the object. A ScheduledRecording service implementation MUST list all classes it supports. If some (vendor-defined) classes are derived from other classes, then both the derived classes and the parent classes MUST be listed. See Appendix C, “AV Working Committee Class Definitions” for details.

Default Value: N/A – Required on input.

Sort Order: Sequenced Lexical. Sequence subvalues are substrings separated by periods.

Input: The desired setting.

Output: The current setting.

B.1.3.1 allowedValueList for the class Property

Table B-2: allowedValueList for the class Property

<table>
<thead>
<tr>
<th>Value</th>
<th>R/O</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“OBJECT.RECORDSCHEDULE.DIRECT.MANUAL”</td>
<td>O</td>
<td></td>
</tr>
<tr>
<td>“OBJECT.RECORDSCHEDULE.DIRECT.CDSEPG”</td>
<td>O</td>
<td></td>
</tr>
<tr>
<td>“OBJECT.RECORDSCHEDULE.DIRECT.CDSNONEPG”</td>
<td>R</td>
<td></td>
</tr>
<tr>
<td>“OBJECT.RECORDSCHEDULE.DIRECT.PROGRAMCODE”</td>
<td>O</td>
<td></td>
</tr>
<tr>
<td>“OBJECT.RECORDSCHEDULE.QUERY.CONTENTNAME”</td>
<td>O</td>
<td></td>
</tr>
<tr>
<td>“OBJECT.RECORDSCHEDULE.QUERY.CONTENTID”</td>
<td>O</td>
<td></td>
</tr>
<tr>
<td>“OBJECT.RECORDTASK”</td>
<td>O</td>
<td></td>
</tr>
</tbody>
</table>

vendor-defined.

Vendor-defined class names MUST obey the rules set forth in Appendix D.3, “Class Name Syntax”.

See Appendix C.1, “Class Hierarchy” for rules on vendor-defined class extensions.

B.1.4 additionalStatusInfo

Namespace: srs Property Data Type: xsd:string Multi-Valued: NO

Description: The additionalStatusInfo property is a general-purpose property that can hold text-based additional status information.

© 2013, UPnP Forum. All rights Reserved.
Default Value: N/A – Output only.
Sort Order: Lexical.
Input: N/A.
Output: The current setting.

B.1.5  **cdsReference**

Namespace: srs  Property Data Type: xsd:string  Multi-Valued: YES

Description: The cdsReference property MUST only contain metadata of a ContentDirectory service object that is referenced (directly or indirectly) by a recordSchedule or recordTask object.

Note that this is a multi-valued property so that metadata of multiple referenced ContentDirectory service objects can be stored. A recordSchedule or recordTask object references ContentDirectory service objects through properties, such as the scheduledCDSObjectID property, recordedCDSObjectID property, etc. (collectively indicated by the notation: xxxCDSObjectID property). To indicate which cdsReference property is associated with which xxxCDSObjectID property, both properties have a dependent property, cdsReference@link and xxxCDSObjectID@link respectively, that MUST contain the same unique, vendor-defined link identifier.

The cdsReference property MUST contain a valid and properly escaped DIDL-Lite XML Document. The DIDL-Lite XML Document describes a device-dependent (sub)set of imported properties (metadata) of the ContentDirectory service object that is referenced by the linked xxxCDSObjectID property. See Appendix B.17, “ContentDirectory Service Imported Properties” for details.

Default Value: N/A – Output only.
Sort Order: Sorting on this property is meaningless and will be ignored.
Input: N/A.
Output: The current setting.

B.1.5.1  **cdsReference@link**

Namespace: srs  Property Data Type: xsd:string  Multi-Valued: NO

Description: The cdsReference@link contains a unique, vendor-defined link identifier that unambiguously links its cdsReference property to a particular xxxCDSObjectID property within the same recordSchedule or recordTask object. See Appendix B.17, “ContentDirectory Service Imported Properties” for details.

Default Value: N/A – Output only.
Sort Order: Lexical or Lexical Numeric.

Each implementation SHOULD use the sort method most appropriate for its method of generating cdsReference@link values. If cdsReference@link values contain a numeric (substring that contains values that increment with each new object creation), then use Lexical Numeric; otherwise, use Lexical

Input: N/A.
Output: The current setting.
B.2 Priority Properties

Table B-3: Priority Properties

<table>
<thead>
<tr>
<th>Property Name</th>
<th>NS</th>
<th>Data Type</th>
<th>M-Val</th>

<tr>
<td>priority@orderedValue</td>
<td>srs</td>
<td>xsd:unsignedInt</td>
<td>NO</td>
<td>Appendix B.2.1.2</td>
</tr>
<tr>
<td>desiredPriority</td>
<td>srs</td>
<td>xsd:string</td>
<td>NO</td>
<td>Appendix B.2.2</td>
</tr>
</tbody>
</table>

B.2.1 priority

Namespace: srs  Property Data Type: xsd:string  Multi-Valued: NO

Description: The priority property indicates the priority level of the associated object (a recordSchedule or a recordTask). The priority-value format syntax of the priority property is described in Appendix D, “EBNF Syntax Definitions”.

Example values for this property include: “L1”, “L2”, “L3”, … where “L1” represents the highest priority level with subsequent values representing progressively lower priority levels.

Note: Desired priority settings are specified via the desiredPriority property passed into the CreateRecordSchedule() action. See Section 2.8, “ScheduledRecording Service Priority Model” for details.

Default Value: N/A – Output only.

Sort Order: Property Specific, based on priority order. Ascending: lowest priority first.

Input: N/A.

Output: The current setting.

B.2.1.1 allowedValueList for the priority Property

Table B-4: allowedValueList for the priority Property

<table>
<thead>
<tr>
<th>Value</th>
<th>R/O</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“L1”</td>
<td>R</td>
<td>The highest priority level supported by the device.</td>
</tr>
<tr>
<td>“L2”</td>
<td>O</td>
<td>The next progressively lower priority level supported by the device.</td>
</tr>
<tr>
<td>...</td>
<td>O</td>
<td>Progressively lower priority level supported by the device.</td>
</tr>
<tr>
<td>“L&lt;x&gt;”</td>
<td>O</td>
<td>The lowest priority level supported by the device where &lt;x&gt; is the total number of distinct priority levels supported by the device.</td>
</tr>
</tbody>
</table>

Notes:
All devices MUST support 1 or more priority levels.
If “L<x>” is supported, then all values between “L1” and “L<x>” MUST be supported.

B.2.1.2 priority@orderedValue

Namespace: srs  Property Data Type: xsd:unsignedInt  Multi-Valued: NO
Description: The `priority@orderedValue` property indicates the relative numerical priority value of the associated object (a `recordSchedule` or a `recordTask`). A value of 1 indicates that this object is the highest priority object of that object type (that is: of all `recordSchedule` instances or all `recordTask` instances). Other ascending values indicate that the object has a progressively lower priority relative to the other objects of that type. A value of $N$ (where $N$ is the total number of objects of that type) indicates that the object is the lowest priority object of that type. No two objects of the same type will have the same value for this property.

Note: This property is not evented when the priority of the object changes (for example due to the creation of a new object with a higher priority).

Default Value: N/A – Output only.

Sort Order: Numeric.

Input: N/A.

Output: The current setting.

B.2.2 `desiredPriority`

Namespace: srs Property Data Type: xsd:string Multi-Valued: NO

Description: The `desiredPriority` property specifies the desired priority level of the associated object (a `recordSchedule` or a `recordTask`). The `priority-value` format syntax of the `desiredPriority` property is defined in Appendix D, “EBNF Syntax Definitions”.

Except as noted below, the value for this property MUST match one of the allowed values returned by the `GetInputPropertyInfo()` action for this property. The allowed values MUST comply with the table in Appendix B.2.2.1, “allowedValueLists for the `desiredPriority` Property” below. Additionally, if the `priority@orderedValue` property is supported, the `desiredPriority` property can also be set to one of the allowed values listed in Table B-6, “Additional allowedValueList for the `desiredPriority` Property”.

Default Value: “DEFAULT”.

Sort Order: Sorting on this property is meaningless and will be ignored.

Input: The desired setting.

Output: The current setting.

B.2.2.1 allowedValueLists for the `desiredPriority` Property

Table B-5: Primary allowedValueList for the `desiredPriority` Property

<table>
<thead>
<tr>
<th>Value</th>
<th>R/O</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“DEFAULT”</td>
<td>R</td>
<td>No priority preference. The device itself will determine the object’s priority.</td>
</tr>
<tr>
<td>“L1”</td>
<td>O</td>
<td>The highest priority level supported by the device.</td>
</tr>
<tr>
<td>“L2”</td>
<td>O</td>
<td>The next to highest priority level supported by the device.</td>
</tr>
<tr>
<td>...</td>
<td>O</td>
<td>Progressively lower priority levels between 1 and <code>&lt;x&gt;</code>, “L3”, “L4”, etc.</td>
</tr>
<tr>
<td>“L&lt;x&gt;”</td>
<td>O</td>
<td>The lowest priority level supported by the device where <code>&lt;x&gt;</code> is the total number of distinct priority levels supported by the device.</td>
</tr>
</tbody>
</table>
Notes:
All devices MUST support 1 or more priority levels.

If “$L_{<x>}$” is supported, then all values between “$LI$” and “$L_{<x>}$” MUST be continuously supported; that is: a device MUST not support only “$LI$”, “$L3$”, and “$L5$”.

Additionally, if the device supports the priority@orderedValue property, then the device MUST also support the following allowed values. Conversely, if any of these allowed values are supported, then the device MUST support the priority@orderedValue property. These allowed values provide a mechanism for more precise prioritization control with those devices that support it.

### Table B-6: Additional allowedValueList for the desiredPriority Property

<table>
<thead>
<tr>
<th>Value</th>
<th>R/O</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“HIGHEST”</td>
<td>R</td>
<td>The highest level possible. – Same as “$L1_{HI}$” defined below.</td>
</tr>
<tr>
<td>“LOWEST”</td>
<td>R</td>
<td>The lowest level possible. – Same as “$L&lt;x&gt;_{LOW}$” defined below.</td>
</tr>
<tr>
<td>“$L1_{HI}$”</td>
<td>R</td>
<td>The highest priority possible within the highest priority level.</td>
</tr>
<tr>
<td>“$L1_{LOW}$”</td>
<td>R</td>
<td>The lowest priority possible within the highest priority level.</td>
</tr>
<tr>
<td>“$L2_{HI}$”</td>
<td>R</td>
<td>The highest priority possible within the next to highest priority level.</td>
</tr>
<tr>
<td>“$L2_{LOW}$”</td>
<td>R</td>
<td>The lowest priority possible within the next to highest priority level.</td>
</tr>
<tr>
<td>…</td>
<td>R</td>
<td>Progressively lower priority levels.</td>
</tr>
<tr>
<td>“$L&lt;x&gt;_{HI}$”</td>
<td>R</td>
<td>The highest priority possible within the lowest priority level where $&lt;x&gt;$ is the total number of distinct priority levels supported by the device.</td>
</tr>
<tr>
<td>“$L&lt;x&gt;_{LOW}$”</td>
<td>R</td>
<td>The lowest priority possible, but within the lowest priority level where $&lt;x&gt;$ is the total number of distinct priority levels supported by the device.</td>
</tr>
<tr>
<td>&lt;$@id$&gt;</td>
<td>R</td>
<td>The next highest priority “slot” immediately higher than (but within the same priority level of) the existing object whose @$id$ is specified by &lt;$@id$&gt;.</td>
</tr>
</tbody>
</table>

Notes:
1. If a device supports the priority@orderedValue property, then the device MUST also support these CONDITIONALLY REQUIRED allowed values. Conversely, if any of these allowed values are supported, then the device MUST support the priority@orderedValue property.

2. These allowed values provide a mechanism for more precise prioritization control with those devices that support it. If “$L<x>_{LOW}$” is supported, then all values between “$L1_{HI}$” and “$L<x>_{LOW}$” MUST be continuously supported; that is: a device MUST not support only “$L1_{HI}$”, “$L1_{LOW}$”, “$L3_{HI}$”, “$L3_{LOW}$”, “$L5_{HI}$” and “$L5_{LOW}$” or only “$L1_{HI}$”, “$L2_{HI}$”, and “$L3_{HI}$”.

B.2.3  **desiredPriority@type**

Namespace: srs  
Property Data Type: xsd:string  
Multi-Valued: **NO**

**Description:** When the **desiredPriority@type** property is set to “**PREDEF**”, it indicates that the **desiredPriority** property contains one of the predefined priority labels (“**L1**”, “**L2_LOW**”, etc.). When set to “**OBJECTID**”, it indicates that the **desiredPriority** property contains an object ID (@id value).

**Default Value:** “**PREDEF**”.

**Sort Order:** Sorting on this property is meaningless and will be ignored.

**Input:** The desired setting.

**Output:** The current setting.

### B.2.3.1 allowedValueLists for the **desiredPriority@type** Property

### B.3.1  **recordDestination**

Namespace: srs  
Property Data Type: xsd:string  
Multi-Valued: **YES**

**Description:** The **recordDestination** property identifies the storage unit to be used for the recording. This identifier, which is to be generated by the ScheduledRecording service, SHOULD be a user-friendly name for the storage unit so that its value is meaningful to a user when displayed.

This is a multi-valued property so that more than one record destination can be specified for a recording. The **recordDestination@preference** property allows the order of preference among multiple record destinations to be specified. If none of the specified record destinations is available at the time of recording, then the recording MUST NOT take place.

**Examples:** “**Hard Disk Drive**”, “**DVD-J**”, “**LINE1**”, “**AUX-out**” etc.

**Default Value:** Vendor-defined.

**Sort Order:** Lexical.
Input: The desired setting.

Output: The current setting.

B.3.1.1  recordDestination@mediaType

Namespace: srs     Property Data Type: CSV (xsd:string)     Multi-Valued: NO

Description: The recordDestination@mediaType property indicates the type of media that is to be used for the recording.

If the media type of the specified record destination is fixed (not removable), then the value of the recordDestination@mediaType property MUST match the actual physical media type of the record destination. This single value can be retrieved through the GetAllowedValues() action.

If the media of the specified record destination is manually removable (requires explicit user intervention) then the currently inserted physical media MUST match one of the values in the recordDestination@mediaType property. In other words, the specified list of media types indicates those that are acceptable for the recording. If the current physical media does not match one of the acceptable media types, then the recording MUST NOT take place on this record destination.

If the specified record destination supports automatic swapping of media, such as a jukebox recorder, then the recordDestination@mediaType property indicates which media type(s) MUST be used for the recording. Recording MUST occur on the available media type that appears earliest in the list. If none of the specified media types is available for recording, then the recording MUST NOT take place on this record destination.

If recording can not take place as described above, then lower preference record destinations MAY be used (see Section B.3.1.3, “recordDestination@preference”). The set of allowed values for the recordDestination@mediaType property can be retrieved through the GetAllowedValues() action.

Examples: “HDD”, “DVD-RW”

Default Value: Vendor-defined.

Sort Order: Sequenced Lexical.

Input: The desired setting.

Output: The current setting.

B.3.1.1.1 allowedValueList for the recordDestination@mediaType Property

One of the allowed values for the AVTransport::RecordStorageMedium state variable MUST be specified. Please refer to the AVTransport service specification for the table of allowed values.

B.3.1.2  recordDestination@targetURL

Namespace: srs     Property Data Type: xsd:anyURI     Multi-Valued: NO

Description: The recordDestination@targetURL property MUST contain a URL that identifies the location, such as the location of a directory, where the recorded content is to be stored.

Examples:

“file:///D:/MyDocuments/MyVideos”

“http://10.0.0.1/MyDocuments/MyVideos”

Default Value: Vendor-defined.

Sort Order: Lexical.
**B.3.1.3** \textit{recordDestination@preference}

**Namespace:** srs  
**Property Data Type:** xsd:unsignedInt  
**Multi-Valued:** NO

**Description:** The \textit{recordDestination@preference} property is useful when multiple \textit{recordDestination} properties are specified within the same \textit{recordSchedule} or \textit{recordTask} object. In this case, the values indicate the preference order of the multiple record destinations. Higher numbers indicate lower preference. The values do not have to be contiguous.

If multiple \textit{recordDestination@preference} properties have the same value, then the order of preference in which their associated record destinations are chosen is device-dependent.

If the \textit{recordDestination@preference} property is not supported by an implementation, then the order of preference of all specified record destinations is device-dependent.

**Default Value:** Vendor-defined.

**Sort Order:** Numeric.

**Input:** The desired setting.

**Output:** The current setting.

---

**B.3.2** \textit{desiredRecordQuality}

**Namespace:** srs  
**Property Data Type:** CSV (xsd:string)  
**Multi-Valued:** NO

**Description:** The \textit{desiredRecordQuality} property is used to express the desired or preferred recording quality level(s) for a particular \textit{recordSchedule}. Multiple recording quality levels can be specified in the comma-separated value list of the \textit{desiredRecordQuality} property. If there is more than one value specified, then the values indicate the desired recording quality, in order of preference, highest preference first. The value “AUTO” MUST be supported by all implementations. When “AUTO” is included in the list, it MUST appear as the last value in the list and indicates that if none of the preceding values are available, then the ScheduledRecording service is free to use any recording quality level to maximize the probability that the recording actually takes place. When the “AUTO” value is the only value in the list, then the ScheduledRecording service is free to use any recording quality level.

There are many ways to express recording quality. Some implementations use bitrates, some use user-friendly labels etc. Some implementations might even support multiple ways to express recording quality simultaneously. The \textit{desiredRecordQuality} property is used in conjunction with the \textit{desiredRecordQuality@type} to allow implementations to express these variations. However, since the \textit{desiredRecordQuality} property can appear only once, the acceptable recording quality levels for a particular \textit{recordSchedule} are restricted to a single type variation.

If an implementation is capable of encoding or transcoding, then it MAY do so in order to achieve the desired recording quality.

**Example:** Assume a (hypothetical) implementation that supports the type variations “DEFAULT”, “ATSC” and “QLEVEL” for the \textit{desiredRecordQuality@type} property. The following table expresses the supported \textit{desiredRecordQuality} property values for those variations and also indicates how the different type variations interrelate for this particular implementation:
Table B-9:  \textit{desiredRecordQuality} Example

<table>
<thead>
<tr>
<th>“DEFAULT”</th>
<th>“ATSC”</th>
<th>“QLEVEL”</th>
</tr>
</thead>
<tbody>
<tr>
<td>“HD”</td>
<td>“1080p30”</td>
<td>“Q1”</td>
</tr>
<tr>
<td></td>
<td>“1080p24”</td>
<td></td>
</tr>
<tr>
<td></td>
<td>“720p60”</td>
<td></td>
</tr>
<tr>
<td></td>
<td>“720p30”</td>
<td>“Q2”</td>
</tr>
<tr>
<td>“ED”</td>
<td>“480p60”</td>
<td></td>
</tr>
<tr>
<td>“SD”</td>
<td>“480p30”</td>
<td></td>
</tr>
<tr>
<td></td>
<td>“480p24”</td>
<td></td>
</tr>
<tr>
<td></td>
<td>“480i60”</td>
<td></td>
</tr>
<tr>
<td>“AUTO”</td>
<td>“AUTO”</td>
<td>“AUTO”</td>
</tr>
</tbody>
</table>

- Specifying “HD,ED” in the \textit{desiredRecordQuality} property and “DEFAULT” in the \textit{desiredRecordQuality@type} property will result in the following:
  - If possible, the recording will be made using “HD” quality. In this case, it is up to the implementation to determine exactly which recording quality level within the “HD” range will be used for the recording.
  - If recording using “HD” quality is not possible, the recording will be made using “ED” quality, if possible. Again, it is up to the implementation to determine exactly which recording quality level within the “ED” range will be used for the recording.
  - If the recording cannot be made in either “HD” or “ED” quality, then no recording will be made.

- Specifying “ED,SD,AUTO” in the \textit{desiredRecordQuality} property and “DEFAULT” in the \textit{desiredRecordQuality@type} property will result in the following:
  - If possible, the recording will be made using “ED” quality. It is up to the implementation to determine exactly which recording quality level within the “ED” range will be used for the recording.
  - If that is not possible, the recording will be made using “SD” quality, if possible. It is up to the implementation to determine exactly which recording quality level within the “SD” range will be used for the recording.
  - If the recording cannot be made in either “ED” or “SD” quality, then the recording will be made using any other available recording quality.

- Specifying “720p60” in the \textit{desiredRecordQuality} property and “ATSC” in the \textit{desiredRecordQuality@type} property will result in the following:
  - If possible, the recording will be made using “720p60” quality.
  - If that is not possible, no recording will be made.

When the ScheduledRecording service responds to a \textit{GetAllowedValues()} action with \textit{desiredRecordQuality} information, then the allowed values MUST be listed in order of quality from...
The value “AUTO” MUST always be present and appear as the last item in the list.

Default Value: Vendor-defined.

Sort Order: Property Specific, based on the allowedValueList for the desiredRecordQuality property. Ascending: lowest quality first.

Input: The desired setting.
Output: The current setting.

B.3.2.1 allowedValueList for the desiredRecordQuality Property

<table>
<thead>
<tr>
<th>Value</th>
<th>R/O</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“AUTO”</td>
<td>R</td>
<td>If none of the quality levels preceding the “AUTO” value are available, then any recording quality level may be used. The “AUTO” value MUST always appear last in the list when present.</td>
</tr>
<tr>
<td>Vendor-defined</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

B.3.2.2 desiredRecordQuality@type

Namespace: srs  Property Data Type: xsd:string  Multi-Valued: NO

Description: There are many ways to express recording quality. Some implementations use bitrates, some use user-friendly labels etc. Some implementations might even support multiple ways to express recording quality simultaneously. The desiredRecordQuality@type property is used to express which type variation is used in its associated independent desiredRecordQuality property. The “DEFAULT” value MUST be supported and indicates which of the supported type variations is preferred by the device when expressing recording quality levels.

Default Value: Vendor-defined.

Sort Order: Lexical.

Input: The desired setting.
Output: The current setting.

B.3.2.2.1 allowedValueList for the desiredRecordQuality@type Property

#### B.4.1 scheduledCDSObjectID

**Namespace:** srs  
**Property Data Type:** xsd:string  
**Multi-Valued:** **NO**

**Description:** The `scheduledCDSObjectID` property contains the `didl-lite:@id` property value of the ContentDirectory service object from which relevant metadata information is extracted to create the `recordSchedule`.

**Default Value:** N/A – Required on input.

**Sort Order:** Lexical or Lexical Numeric.

Each implementation SHOULD use the sort method most appropriate for its method of generating `didl-lite:@id` values. If `didl-lite:@id` values contain a numeric (sub)string that contains values that increment with each new object creation, then use Lexical Numeric; otherwise, use Lexical.

**Input:** The desired setting.

**Output:** The current setting.

#### B.4.1.1 scheduledCDSObjectID@link

**Namespace:** srs  
**Property Data Type:** xsd:string  
**Multi-Valued:** **NO**

**Description:** The `scheduledCDSObjectID@link` contains a unique, vendor-defined link identifier that unambiguously links its `scheduledCDSObjectID` property to a particular `cdsReference` property instance within the same `recordSchedule` object. See Appendix B.17, “ContentDirectory Service Imported Properties” for details.

**Default Value:** N/A – Output only.

**Sort Order:** Same as `cdsReference@link`.

**Input:** N/A.

**Output:** The current setting.
B.4.2  scheduledChannelID

Namespace: srs  Property Data Type: xsd:string  Multi-Valued: NO

Description: The scheduledChannelID property provides channel information for the recordSchedule. Its format depends on the scheduledChannelID@type property as follows:

If scheduledChannelID@type = "ANALOG" then the scheduledChannelID property contains the channel number.

Note: The label “ANALOG” actually is a misnomer. The format of the scheduledChannelID property does not indicate the nature of the channel (analog versus digital). Rather, it merely indicates the format of the label (for example, a single channel number versus a channel number pair). Therefore, the label “ANALOG” should be interpreted as meaning: the scheduledChannelID property’s format is a single channel number.

Examples: “5”, “7”, etc.

If scheduledChannelID@type = “DIGITAL” then the scheduledChannelID property contains the channel number pair "<Major Channel Number>,<Minor Channel Number>".

Note: The label “DIGITAL” actually is a misnomer. The format of the scheduledChannelID property does not indicate the nature of the channel (analog versus digital). Rather, it merely indicates the format of the label (for example, a single channel number versus a channel number pair). Therefore, the label “DIGITAL” should be interpreted as meaning: the scheduledChannelID property’s format is a channel number pair.

Examples: “5,1”, “5,2”, etc.

If scheduledChannelID@type = “FREQUENCY” then the scheduledChannelID property contains the channel center frequency, expressed in Hz.

Examples: “150125000” (VHF band), “615000000” (UHF band), “96500000” (FM band), etc.

If scheduledChannelID@type = “SI” then the scheduledChannelID property contains the Service Information Triplet “<Network ID>,<Transport Stream ID>, <Service ID>”, embedded in the content stream.

Examples: “0x1234,0xFEDC,0x0102”, “12345,23456,32109”, etc.

If scheduledChannelID@type = “LINE” then the scheduledChannelID property contains a vendor-defined label identifying the line input.

Examples: “Line 1”, “AUX”, “Front”, “Rear”, etc.

If scheduledChannelID@type = “NETWORK” then the scheduledChannelID property contains the URI that uniquely identifies the content to be recorded.

Default Value: N/A – Required on input.

Sort Order: type  Relationship.

“ANALOG”: Numeric.

“DIGITAL”: Sequeced numeric.

“FREQUENCY”: Numeric.

“SI”: Sequenced lexical.

“LINE”: Lexical.

© 2013, UPnP Forum. All rights Reserved.
“NETWORK”: Lexical.

Vendor-defined: Vendor-defined sorting.

Input: The desired setting.

Output: The current setting.

B.4.2.1  \textit{scheduledChannelID@type}

<table>
<thead>
<tr>
<th>Property Data Type: \texttt{xsd:string}</th>
<th>Multi-Valued: \texttt{NO}</th>
</tr>
</thead>
</table>

Description: The \texttt{scheduledChannelID@type} property determines the format that is used for the \texttt{scheduledChannelID} property as defined above.

Default Value: N/A – Required on input.

Sort Order: Property Specific, based on the order in Table B-13. Ascending: first table entry first. If there is a single vendor-defined value, it sorts in table position. If there are multiple vendor-defined values, they sort lexically among themselves, all after the Table B-13 entries in ascending order and all before the Table B-13 entries in descending order.

Input: The desired setting.

Output: The current setting.

B.4.2.1.1  allowedValueList for the \textit{scheduledChannelID@type} Property

Table B-13: allowedValueList for the \textit{scheduledChannelID@type} Property

<table>
<thead>
<tr>
<th>Value</th>
<th>R/O</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“ANALOG”</td>
<td>O</td>

<td>X</td>
<td></td>
</tr>
</tbody>
</table>

At least one value in these rows MUST be supported by a compliant ScheduledRecording service implementation. Control points should support \textit{all} values in these rows.

B.4.2.2  \textit{scheduledChannelID@distriNetworkName}

<table>
<thead>
<tr>
<th>Property Data Type: \texttt{xsd:string}</th>
<th>Multi-Valued: \texttt{NO}</th>
</tr>
</thead>
</table>

Description: The \texttt{scheduledChannelID@distriNetworkName} property contains the name of the Distribution Network that provides the channel, identified by the \texttt{scheduledChannelID} property.

Default Value: Vendor-defined.

Sort Order: Lexical.

Input: The desired setting.

Output: The current setting.
B.4.2.3  **scheduledChannelID@distriNetworkID**

*Namespace:* srs  
*Property Data Type:* xsd:string  
*Multi-Valued:* **NO**

**Description:** The `scheduledChannelID@distriNetworkID` property contains an ID that uniquely identifies the Distribution Network that provides the channel, identified by the `scheduledChannelID` property.

**Default Value:** Vendor-defined.

**Sort Order:** Lexical.

**Input:** The desired setting.

**Output:** The current setting.

---

B.4.3  **scheduledStartDateTime**

*Namespace:* srs  
*Property Data Type:* xsd:string  
*Multi-Valued:* **YES**

**Description:** The `scheduledStartDateTime` property indicates what date or day(s) and time the recording will take place. This property does not account for any recording time adjustments such as `scheduledStartDateTimeAdjust`, and device latencies.

The `sched-start` format syntax of the `scheduledStartDateTime` property is defined in Appendix D, “EBNF Syntax Definitions”.

Examples: “02-07T15:30:00” (February 7th, 3:30pm), “2005-02-07T15:30:00” (February 7th, 2005, 3:30pm), “MONT15:30:00” (Mondays at 3:30pm), “T15:30:00” (Every day at 3:30pm)

Recording(s) will occur on the next occurrence(s) of the specified date or day(s) and time until the total number of desired recordings (as indicated by the `totalDesiredRecordTasks` property) has been made.

Note that the `scheduledStartDateTime` property is a multi-valued property. Therefore, multiple date&times can be specified for the same `recordSchedule`. Recording will occur on every next occurrence of any of the specified start date&times until the total number of desired recordings (as indicated by the `totalDesiredRecordTasks` property) has been made.

See Appendix B.7.1, “`totalDesiredRecordTasks`” for further details on the use of the `totalDesiredRecordTasks` property.

The value “**NOW**” is defined by this specification to indicate that the recording MUST start immediately (as soon as possible).

**Default Value:** N/A – Required on input.

**Sort Order:** Property Specific, in chronological order.

**Input:** The desired setting.

**Output:** The current setting.

---

B.4.4  **scheduledDuration**

*Namespace:* srs  
*Property Data Type:* xsd:string  
*Multi-Valued:* **NO**

**Description:** The `scheduledDuration` property indicates the scheduled duration of the recording. The `duration` format syntax of the `scheduledDuration` property is defined in Appendix D, “EBNF Syntax Definitions”.

Examples: “P01:30:00” (one hour and thirty minutes), “P2D01:15:00” (two-day and seventy five minutes recording).
This property does not necessarily represent the exact recording duration but represents the scheduled recording duration. This property does not account for any recording time adjustments such as scheduledDurationAdjust, and device latencies.

Default Value: N/A – Required on input.

Sort Order: Property Specific, based on elapsed time. Ascending: shortest elapsed time first.

Input: The desired setting.

Output: The current setting.

B.4.5 **scheduledProgramCode**

Namespace: srs  
Property Data Type: xsd:string  
Multi-Valued: **NO**

Description: The **scheduledProgramCode** property indicates the program code provided by a program guide service of a particular program item. The format of the program code is defined by the program guide service. A **scheduledProgramCode@type** property MUST be specified with this property to identify the program guide service used.

Default Value: N/A – Required on input.

Sort Order: Sorting on this property is meaningless and will be ignored.

Input: The desired setting.

Output: The current setting.

B.4.5.1 **scheduledProgramCode@type**

Namespace: srs  
Property Data Type: xsd:string  
Multi-Valued: **NO**

Description: The **scheduledProgramCode@type** property indicates the type of the program guide service that defines the program code specified in the **scheduledProgramCode** property. The format of this property is “<ICANN registered domain>” “_” “<program code name>”.

Default Value: N/A – Required on input.

Sort Order: Sorting on this property is meaningless and will be ignored.

Input: The desired setting.

Output: The current setting.

B.5 **Matching Content Criteria Properties**

Table B-14: Matching Content Criteria Properties

<table>
<thead>
<tr>
<th>Property Name</th>
<th>NS</th>
<th>Data Type</th>
<th>M-Val</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>matchingName</td>
<td>srs</td>
<td>xsd:string</td>
<td><strong>NO</strong></td>
<td>Appendix B.5.1</td>
</tr>
<tr>
<td>matchingName@type</td>
<td>srs</td>
<td>xsd:string</td>
<td><strong>NO</strong></td>
<td>Appendix B.5.1.1</td>
</tr>

<td>Appendix B.5.2</td>
</tr>
<tr>
<td>matchingID@type</td>
<td>srs</td>
<td>xsd:string</td>
<td><strong>NO</strong></td>
<td>Appendix B.5.2.1</td>
</tr>
</tbody>
</table>
B.5.1  **matchingName**

**Namespace**: srs  **Property Data Type**: xsd:string  **Multi-Valued**: NO

**Description**: The `matchingName` property contains (part of) the name of a program or series. To match the criteria of this `recordSchedule`, an external item’s name information MUST (partially) match the specified `matchingName` value. Matching SHOULD be done using lexical matching (see Section 2.2.2.27, “Lexical Matching”). It MAY be done using simple non-case-sensitive matching (see Section 2.2.2.29, “Simple Non-case-sensitive Matching”).

Example: “NFL Worldcup 2005”, “Friends”.

**Default Value**: N/A – Required on input.

**Sort Order**: Lexical.

Note: This is an exception to the normal rule of **type** Relationship sorting. The equivalent of **type** Relationship sorting may be achieved by including “+srs:matchingName@type” in the sort property list immediately in front of “+srs:matchingName”.

**Input**: The desired setting.

**Output**: The current setting.

B.5.1.1  **matchingName@type**

**Namespace**: srs  **Property Data Type**: xsd:string  **Multi-Valued**: NO

**Description**: IF set to “PROGRAM”, then the `matchingName` property contains a program name. If set to “SERIES”, then the `matchingName` property contains a series name.

**Default Value**: N/A – Required on input.

**Sort Order**: Property Specific, based on the order in Table B-15. Ascending: first table entry first.

**Input**: The desired setting.

**Output**: The current setting.

B.5.1.1.1  **allowedValueList for the matchingName@type Property**

**Table B-15**: **allowedValueList for the matchingName@type Property**

<table>
<thead>
<tr>
<th>Value</th>
<th>R/O</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“PROGRAM”</td>
<td>R</td>
<td></td>
</tr>
<tr>
<td>“SERIES”</td>
<td>R</td>
<td></td>
</tr>
</tbody>
</table>

B.5.1.2  **matchingName@subStringMatch**

**Namespace**: srs  **Property Data Type**: xsd:boolean  **Multi-Valued**: NO

**Description**: If set to “1”, the value specified in the `matchingName` property is used for a substring match search within the program or series name (title). If set to “0” the value specified in the `matchingName` property must match the program or series name exactly.

**Default Value**: “1”.

**Sort Order**: Boolean.

**Input**: The desired setting.
Output: The current setting.

B.5.2  matchingID

Namespace: srs  Property Data Type: xsd:string  Multi-Valued: NO

Description: The matchingID property contains the unique ID of a program or series. To match the criteria of this recordSchedule, an external item’s ID information MUST match the specified matchingID value.

If the matchingID@type property is set to “SI_PROGRAMID”, then the matchingID property is formatted as follows:

“<Network ID>,<Transport Stream ID>,<Service ID>,<Program ID>”.

If the matchingID@type property is set to “SI_SERIESID”, then the matchingID property is formatted as follows:

“<Network ID>,<Transport Stream ID>,<Service ID>,<Series ID>”.

If the matchingID@type property is set to <ICANN Name>, then the matchingID property is formatted as follows:

“<Unique content ID, defined by the data provider>”.

Default Value: N/A – Required on input.

Sort Order: Sorting on this property is meaningless and will be ignored.

Input: The desired setting.

Output: The current setting.

B.5.2.1  matchingID@type

Namespace: srs  Property Data Type: xsd:string  Multi-Valued: NO

Description: The matchingID@type property indicates the type of the ID that is contained in the matchingID property.

Default Value: N/A – Required on input.

Sort Order: Sorting on this property is meaningless and will be ignored.

Input: The desired setting.

Output: The current setting.

B.5.2.1.1  allowedValueList for the matchingID@type Property

Table B-16: allowedValueList for the matchingID@type Property

<table>
<thead>

### Value

| <ICANN Name>_<Identifier> | X | \(<\text{ICANN Name}>\): The ICANN name of the organization that defines the format and values of the \textit{matchingID} property. \(<\text{Identifier}>\): A unique identifier for the particular ID type, defined by that organization. Examples: “mycompany.com_ID1”, “upnp.org_SpecialID”. |

</table>

#### B.6.1 matchingChannelID

**Namespace:** srs  
**Property Data Type:** xsd:string  
**Multi-Valued:** YES

**Description:** The \textit{matchingChannelID} property contains a \textit{scheduledChannelID} value. Its format depends on the \textit{matchingChannelID@type} property. To match the criteria of this \textit{recordSchedule}, an external item’s channel information (after translation into the format of a \textit{scheduledChannelID} property) MUST match one of the specified \textit{matchingChannelID} values. If this property is omitted from the \textit{recordSchedule}, the external item’s channel information is not taken into consideration to determine a match.

**Default Value:** N/A – Not used if omitted on input.

**Sort Order:** Same as \textit{scheduledChannelID}.

**Input:** The desired setting.

**Output:** The current setting if specified on input. Otherwise not present.

#### B.6.1.1 matchingChannelID@type

**Namespace:** srs  
**Property Data Type:** xsd:string  
**Multi-Valued:** NO
Description: The `matchingChannelID@type` property determines the format that is used for the `matchingChannelID` property as defined in Appendix B.4.2, “`scheduledChannelID`” and Appendix B.4.2.1, “`scheduledChannelID@type`”.

Default Value: N/A – Not used if omitted on input.

Sort Order: Same as `scheduledChannelID@type`.

Input: The desired setting.

Output: The current setting if specified on input. Otherwise not present.

### B.6.1.2 `matchingChannelID@distriNetworkName`

Namespace: srs  
Property Data Type: xsd:string  
Multi-Valued: NO

Description: The `matchingChannelID@distriNetworkName` property definition is identical to the `scheduledChannelID@distriNetworkName` property definition. See Appendix B.4.2.2, “`scheduledChannelID@distriNetworkName`” for details.

Default Value: N/A – Not used if omitted on input.

Sort Order: Same as `scheduledChannelID@distriNetworkName` property.

Input: The desired setting.

Output: The current setting if specified on input. Otherwise not present.

### B.6.1.3 `matchingChannelID@distriNetworkID`

Namespace: srs  
Property Data Type: xsd:string  
Multi-Valued: NO

Description: The `matchingChannelID@distriNetworkID` property definition is identical to the `scheduledChannelID@distriNetworkID` property definition. See Appendix B.4.2.3, “`scheduledChannelID@distriNetworkID`” for details.

Default Value: N/A – Not used if omitted on input.

Sort Order: Same as `scheduledChannelID@distriNetworkID` property.

Input: The desired setting.

Output: The current setting if specified on input. Otherwise not present.

### B.6.2 `matchingStartDateTimeRange`

Namespace: srs  
Property Data Type: xsd:string  
Multi-Valued: YES

Description: The `matchingStartDateTimeRange` property contains a date range. The start-range format syntax of the `matchingStartDateTimeRange` property is defined in Appendix D, “EBNF Syntax Definitions”.

The value specified after the “/” MUST be equal or greater than the value specified before the “/”.

To match the criteria of this `recordSchedule`, an external item’s start date and time information MUST fall within one of the specified `matchingStartDateTimeRange` ranges. If this property is omitted from the `recordSchedule`, the external item’s start date and time information is not taken into consideration to determine a match.

Note: The `matchingStartDateTimeRange` property is different from the `activePeriod` property in that the first identifies the actual matching criteria whereas the second identifies the period of time when potential matches are to be examined.

© 2013, UPnP Forum. All rights Reserved.
Default Value: N/A – Not used if omitted on input.

Sort Order: Sequenced Sort of two date&time subvalues separated by “/”.
Both subvalues are sorted in chronological order.

Input: The desired setting.
Output: The current setting if specified on input. Otherwise not present.

B.6.3 matchingDurationRange

Namespace: srs Property Data Type: xsd:string Multi-Valued: YES

The matchingDurationRange property contains a duration range. The duration-range format syntax of the matchingDurationRange property is defined in Appendix D, “EBNF Syntax Definitions”.

The value specified after the “/” MUST be equal or greater than the value specified before the “/”.

To match the criteria of this recordSchedule, an external item’s duration information (after translation into the format of a scheduledDuration property) MUST fall within the specified matchingDurationRange range. If this property is omitted from the recordSchedule, the external item’s duration information is not taken into consideration to determine a match.

Default Value: N/A – Not used if omitted on input.

Sort Order: Sequenced Sort of two duration subvalues separated by “/”.

Input: The desired setting.
Output: The current setting if specified on input. Otherwise not present.

B.6.4 matchingRatingLimit

Namespace: srs Property Data Type: xsd:string Multi-Valued: YES

Description: The matchingRatingLimit property indicates a maximum allowed rating. Several different rating systems are available. The rating system is indicated in the matchingRatingLimit@type property. The allowed values for the matchingRatingLimit property depend on the rating system used.

Common rating systems as well as their allowed rating values (in order of ascending restriction level beginning with the most lenient) for each rating system are defined below.

Other values MAY be specified using other rating systems identified by their ICANN domain names.

To match the criteria of this recordSchedule, an external item’s rating information MUST be less than or equal to all of the specified matchingRatingLimit values. If this property is omitted from the recordSchedule, the external item’s rating information is not taken into consideration to determine a match. If the external item does not contain rating information and this property is specified, the external item will not be recorded.

Default Value: N/A – Not used if omitted on input.

Sort Order: type Relationship.

For each value of matchingRatingLimit@type, based on the order in the table associated with the matchingRatingLimit@type property below. Ascending: first table entry first.

Input: The desired setting.
Output: The current setting if specified on input. Otherwise not present.
B.6.4.1 allowedValueList for the matchingRatingLimit Property

The allowed values for the matchingRatingLimit property depends on the matchingRatingLimit@type property. The following tables list the allowed values for each defined rating system.

Table B-18: allowedValueList for the matchingRatingLimit Property Using the MPAA Rating System (matchingRatingLimit@type = “MPAA.ORG”)

<table>
<thead>
<tr>
<th>Value</th>
<th>R/O</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“G”</td>

</tbody>
</table>
B.6.4.2  matchingRatingLimit@type

Namespace: srs  Property Data Type: xsd:string  Multi-Valued: NO

Description: The matchingRatingLimit@type property indicates the rating system used in the matchingRatingLimit property. Several different rating systems are available. The allowed values for the matchingRatingLimit property depend on the rating system used.

Other rating systems MAY be specified using their ICANN domain names.

This is not a matching property. It is used in conjunction with the matchingRatingLimit property and identifies the used rating system.

Default Value: N/A – Required in input.

Sort Order: Lexical.

Input: The desired setting.

Output: The current setting.

B.6.4.2.1 allowedValueList for the matchingRatingLimit@type Property

Table B-22: allowedValueList for the matchingRatingLimit@type Property

<td>Examples: “mycompany.com_RS1”, “upnp.org_ratingx”.</td>
<td></td>
</tr>
</tbody>
</table>
B.6.4.3 **matchingRatingLimit@equivalentAge**

Namespace: srs  Property Data Type: xsd:string  Multi-Valued: NO

Description: The `matchingRatingLimit@equivalentAge` property indicates the equivalent age of the rating system used in the `matchingRatingLimit` property. The equivalent age is the minimum age of the underlying rating system which allows the user to view the content.

The `matchingRatingLimit@equivalentAge` property is highly RECOMMENDED if the `matchingRatingLimit` property is specified and the rating of referenced rating system can be translated to a minimum age. If the rating system does not specify equivalent age values, or the specific rating value does not specify an equivalent age, then this property is PROHIBITED.

Default Value: N/A – Required in input.

Sort Order: Lexical.

Input: The desired setting.

Output: The current setting.

B.6.5 **matchingEpisodeType**

Namespace: srs  Property Data Type: xsd:string  Multi-Valued: NO

Description: The `matchingEpisodeType` property indicates the type of content to be recorded in terms of its broadcast novelty. To match the criteria of this `recordSchedule`, an external item’s episode type information MUST match the specified `matchingEpisodeType` value. If this property is omitted from the `recordSchedule`, the external item’s episode type information is not taken into consideration to determine a match. If the external item does not contain episode type information and this property is specified, the external item will not be recorded.

Default Value: N/A – Not used if omitted on input.

Sort Order: Property Specific, based on the order in Table B-23. Ascending: first table entry first.

Input: The desired setting.

Output: The current setting if specified on input. Otherwise not present.

B.6.5.1 **allowedValueList for the matchingEpisodeType Property**

</tbody>
</table>

B.7.1 totalDesiredRecordTasks

Namespace: srs  
Property Data Type: xsd:unsignedInt  
Multi-Valued: NO

Description: The totalDesiredRecordTasks property indicates the maximum number of recordTask instances, associated with a given recordSchedule that will ever be generated over the lifetime of the recordSchedule. A value of 0 means that an unlimited number of recordTask instances can be spawned from the recordSchedule.

This property is used to enable or disable recurrence. If a value different from 1 is specified in the totalDesiredRecordTasks property, then the recordSchedule MUST remain active after the first recordTask has been spawned and MUST monitor its internal state to determine if the conditions that caused the first recordTask to be spawned are met again in the future. Whenever this happens, a new recordTask MUST be spawned until the total number of spawned recordTask instances reaches the value, specified in the totalDesiredRecordTasks property. The activePeriod property can be used to terminate this process prematurely.

Default Value: 1 (recurrence is disabled by default).

Sort Order: Numeric.

Input: The desired setting.

Output: The current setting.

B.7.2 scheduledStartDateTimeAdjust

Namespace: srs  
Property Data Type: xsd:string  
Multi-Valued: NO

Description: The scheduledStartDateTimeAdjust property indicates a time period to be applied as an adjustment to the scheduled start time. The duration-adj format syntax of the scheduledStartDateTimeAdjust property is defined in Appendix D, “EBNF Syntax Definitions”.

Note that the scheduledStartDateTimeAdjust property can take on both positive and negative values. Negative values provide pre-roll functionality (notice the + sign in the formula below) whereas positive values allow for starting the recording a certain period of time into the recording. The actual scheduled start time is calculated as:

© 2013, UPnP Forum. All rights Reserved.
ScheduledRecording: 2

actualScheduledStartTime = scheduledStartTime + scheduledStartTimeAdjust

Default Value: Vendor-defined.

Sort Order: Property Specific, based on elapsed time. Ascending: from longest negative elapsed time to longest positive elapsed time.

Input: The desired setting.

Output: The current setting.

B.7.3 scheduledDurationAdjust

Namespace: srs  Property Data Type: xsd:string  Multi-Valued: NO

Description: The scheduledDurationAdjust property indicates a period of time to be applied as an adjustment to the scheduled duration time. The duration-adj format syntax of the scheduledDurationAdjust property is defined in Appendix D, “EBNF Syntax Definitions”.

Note that the scheduledDurationAdjust property can take on both positive and negative values. Positive values provide post-roll functionality whereas negative values allow for ending the recording a certain time period before the end of the recording. The actual scheduled end time and actual scheduled duration are calculated as:

actualScheduledEndTime = scheduledStartTime + duration + scheduledDurationAdjust

actualScheduledDuration = actualScheduledEndTime – actualScheduledStartTime

= duration + scheduledDurationAdjust – scheduledStartTimeAdjust

Default Value: Vendor-defined.

Sort Order: Property Specific, based on elapsed time. Ascending: from longest negative elapsed time to longest positive elapsed time.

Input: The desired setting.

Output: The current setting.

B.7.4 activePeriod

Namespace: srs  Property Data Type: xsd:string  Multi-Valued: NO

Description: The activePeriod property indicates the date&time range within which the recordSchedule is active; that is: the recordSchedule MUST NOT spawn any recordTask instances whose actualStartTime fall outside the period specified in the activePeriod property. The start-range format syntax of the activePeriod property is defined in Appendix D, “EBNF Syntax Definitions”.

The value specified after the “/” MUST be equal or greater than the value specified before the “/”.

A recordSchedule MUST not generate new recordTask instances for programs broadcast after the expiration date.

A value of “NOW/INFINITY” means that recordTasks corresponding to content that is available from the current time of day into the future are spawned. A value of “PAST/INFINITY” means that there are no time-based restrictions on recordTask instances that are created. Implementations are that are able to temporarily preserve transitory content that was broadcast in the past are allowed to record content that was broadcast in the past. For implementations that are not able to temporarily preserve content, “PAST/INFINITY” is equivalent to “NOW/INFINITY”.

© 2013, UPnP Forum. All rights Reserved.
Note: The activePeriod property is different from the matchingStartDateTimeRange property in that the first identifies the period of time when potential matches are to be examined whereas the second identifies the actual matching criteria.

Default Value: “PAST/INFINITY”.

Sort Order: Sequenced Sort of two date&time subvalues separated by “/”.
Both subvalues are sorted in chronological order.

Input: The desired setting.

Output: The current setting.

B.7.5 durationLimit

Namespace: srs  
Property Data Type: xsd:string  
Multi-Valued: NO

Description: The durationLimit property indicates the maximum allowed duration of the recording. The duration-long format syntax of the durationLimit property is defined in Appendix D, “EBNF Syntax Definitions”.

If the actual duration of the recording exceeds the value specified in the durationLimit property, then the ScheduledRecording service MUST stop recording and either delete the partially recorded content so far or preserve part of the recorded content depending on the current setting of the durationLimit@effect property.

If the durationLimit property is set to “INFINITY”, then no limit is in effect.

Example: the value “P02:30:00” indicates that the recording MUST be stopped after two and a half hours.

Default Value: Vendor-defined.

Sort Order: Property Specific, based on elapsed time. Ascending: shortest elapsed time first.

Input: The desired setting.

Output: The current setting.

B.7.5.1 durationLimit@effect

Namespace: srs  
Property Data Type: xsd:string  
Multi-Valued: NO

Description: The durationLimit@effect property determines the behavior of the recordSchedule when the duration of the content exceeds the value specified in the durationLimit property.

If set to “SKIP”, then the partially recorded content is deleted once the actualDuration of the recording exceeds the value specified in the durationLimit property.

If set to “LAST”, then only the latest part (in length equal to the value specified in the durationLimit property) of the content is preserved, effectively deleting the first part of the recording.

If set to “FIRST”, then only the initial part (in length equal to the value specified in the durationLimit property) of the content is preserved, effectively deleting the last part of the recording.

Default Value: Vendor-defined.

Sort Order: Property Specific, based on the order in Table B-25. Ascending: first table entry first.

Input: The desired setting.

Output: The current setting.
B.7.5.1.1  allowedValueList for the \textit{durationLimit@effect} Property

Table B-25: allowedValueList for the \textit{durationLimit@effect} Property

<table>
<thead>
<tr>
<th>Value</th>
<th>R/O</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“SKIP”</td>
<td>O</td>
<td>At least one value in these rows MUST be supported. Control points should support all values in these rows.</td>
</tr>
<tr>
<td>“LAST”</td>
<td>O</td>
<td></td>
</tr>
<tr>
<td>“FIRST”</td>
<td>O</td>
<td></td>
</tr>
</tbody>
</table>

B.7.6  \textit{channelMigration}

Namespace: srs  
Property Data Type: xsd:boolean  
Multi-Valued: \textit{NO}

Description: A program’s scheduled channel may change between the time the \texttt{recordSchedule} was created and the actual broadcast time. If this property is set to “1”, then the ScheduledRecording service MUST automatically follow the program if it moves to another channel (The reservation will be tracking broadcast channel change). If this value is set to “0”, then the ScheduledRecording service does not follow the program, and the recording will take place on the channel that was specified at the time the \texttt{recordSchedule} created the associated \texttt{recordTask}.

Default Value: Vendor-defined.

Sort Order: Boolean.

Input: The desired setting.

Output: The current setting.

B.7.7  \textit{timeMigration}

Namespace: srs  
Property Data Type: xsd:boolean  
Multi-Valued: \textit{NO}

Description: A program’s scheduled date\&time may change between the time the \texttt{recordSchedule} was created and the actual broadcast time. If this property is set to “1”, then the ScheduledRecording service MUST automatically follow the program if it moves to another date\&time (The reservation will be tracking broadcast date\&time change). If this value is set to “0”, then the ScheduledRecording service does not follow the program, and the recording will take place at the date\&time that was specified at the time the \texttt{recordSchedule} created the associated \texttt{recordTask}.

Default Value: Vendor-defined.

Sort Order: Boolean.

Input: The desired setting.

Output: The current setting.

B.7.8  \textit{allowDuplicates}

Namespace: srs  
Property Data Type: xsd:boolean  
Multi-Valued: \textit{NO}

Description: If set to “1”, then programs are recorded, even if a duplicate program has already been recorded as a result of the \texttt{recordSchedule}. If set to “0”, no duplicates are recorded. Detection of duplicate programs is device- and EPG-dependent.

Default Value: Vendor-defined.

Sort Order: Boolean.
### B.8 Storage Related Properties

#### Table B-26: Storage Related Properties

<table>
<thead>
<tr>
<th>Property Name</th>
<th>NS</th>
<th>Data Type</th>
<th>M-Val</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>
<td>persistedRecordings</td>
<td>srs</td>
<td>xsd:unsignedInt</td>

<td>NO</td>
<td>Appendix B.8.1.2</td>
</tr>
<tr>
<td>persistedRecordings@storedLifetime</td>
<td>srs</td>
<td>xsd:string</td>
<td>NO</td>
<td>Appendix B.8.1.3</td>
</tr>
</tbody>
</table>

#### B.8.1 persistedRecordings

**Namespace:** srs  
**Property Data Type:** xsd:unsignedInt  
**Multi-Valued:** NO  

**Description:** The `persistedRecordings` property indicates the minimum number of recordings for a given `recordSchedule` that will be preserved at all times, once available. Even when the ScheduledRecording service needs to make space for other recordings, this minimum number of recordings (that is: the actual content) generated by the `recordSchedule` will not be deleted. However, if more recordings, associated with the `recordSchedule` exist, then these excess recordings MAY be deleted by the ScheduledRecording service. Whether the oldest or the newest excess recordings will be deleted depends on the value of the `persistedRecordings@latest` property.

**Default Value:** Vendor-defined.

**Sort Order:** Numeric.

**Input:** The desired setting.

**Output:** The current setting.

#### B.8.1.1 persistedRecordings@latest

**Namespace:** srs  
**Property Data Type:** xsd:boolean  
**Multi-Valued:** NO  

**Description:** The `persistedRecordings@latest` property indicates whether newest or oldest recordings are preserved. If set to “1”, then the newest recordings are preserved. The recordings prior to these MAY be deleted when more recent content is recorded.

If set to “0”, then the oldest recordings are preserved. Older content will never be deleted to make room for newer content.

**Default Value:** Vendor-defined.

**Sort Order:** Boolean.

**Input:** The desired setting.

**Output:** The current setting.

#### B.8.1.2 persistedRecordings@preAllocation

**Namespace:** srs  
**Property Data Type:** xsd:boolean  
**Multi-Valued:** NO  

**Description:** The `persistedRecordings@preAllocation` property indicates whether newest or oldest recordings are preserved. If set to “1”, then the newest recordings are preserved. The recordings prior to these MAY be deleted when more recent content is recorded.

If set to “0”, then the oldest recordings are preserved. Older content will never be deleted to make room for newer content.

**Default Value:** Vendor-defined.

**Sort Order:** Boolean.

**Input:** The desired setting.

**Output:** The current setting.
**Description:** The `persistedRecordings@preAllocation` property indicates whether to reserve storage space on beforehand to accommodate for the number of recordings as indicated by the `persistedRecordings` property. If set to “1”, adequate storage space is reserved. To reserve storage space, the ScheduledRecording service calculates a best estimate based on parameters such as record quality, start time and duration adjustment etc. However, the ScheduledRecording service can never guarantee that sufficient storage space is reserved to accommodate the total number of recordings, specified in the `persistedRecordings` property. If set to “0”, no storage space is reserved.

**Default Value:** Vendor-defined.

**Sort Order:** Boolean.

**Input:** The desired setting.

**Output:** The current setting.

### B.8.1.3 `persistedRecordings@storedLifetime`

**Namespace:** `srs`  **Property Data Type:** `xsd:string`  **Multi-Valued:** `NO`

**Description:** The `persistedRecordings@storedLifetime` property indicates the minimum time recorded content associated with a `recordSchedule` will be preserved after the recording completes. This will prohibit a recording from being deleted by the auto-delete operation within the specified time period. The duration—any format syntax of the `persistedRecordings@storedLifetime` property is defined in Appendix D, “EBNF Syntax Definitions”.

If the value is set to “INFINITY”, then the content MUST never be automatically deleted.

A value of “ANY” indicates that the content can be deleted at any time by the auto-delete operation. However, it is RECOMMENDED that a ScheduledRecording service implementation only deletes content when space is needed.

**Default Value:** Vendor-defined.

**Sort Order:** Property Specific, based on elapsed time. Ascending: shortest elapsed time first. “ANY” is considered the shortest elapsed time possible; “INFINITY” is considered the longest elapsed time possible.

**Input:** The desired setting.

**Output:** The current setting.

### B.9 Schedule State Properties

**Table B-27: Schedule State Properties**

<table>

<td>Appendix B.9.2</td>
</tr>
</tbody>
</table>

### B.9.1 `scheduleState`

**Namespace:** `srs`  **Property Data Type:** `xsd:string`  **Multi-Valued:** `NO`

**Description:** The `scheduleState` property indicates the overall state of the `recordSchedule` itself.

**Default Value:** N/A – Output only.
Sort Order: Property Specific, based on the order in Table B-28. Ascending: first table entry first.

Input: N/A.

Output: The current setting.

B.9.1.1 allowedValueList for the **scheduleState** Property

Table B-28: allowedValueList for the **scheduleState** Property

<table>
<thead>
<tr>
<th>Value</th>
<th>R/O</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“OPERATIONAL”</td>
<td>R</td>
<td>recordSchedule is operating and spawning recordTask instances as scheduled.</td>
</tr>
<tr>
<td>“COMPLETED”</td>
<td>R</td>
<td>recordSchedule is completed and reached final disposition. No properties will change.</td>
</tr>
<tr>
<td>“ERROR”</td>
<td>R</td>
<td>recordSchedule ceases spawning recordTask instances due to error.</td>
</tr>
</tbody>
</table>

B.9.1.2 **scheduleState@currentErrors**

Namespace: srs Property Data Type: CSV (xsd:int) Multi-Valued: NO

Description: The **scheduleState@currentErrors** property indicates the current error(s) that cause the schedule to be in the “ERROR” state. This error list pertains specifically to the behavior of a recordSchedule and describes a recordSchedule’s inability to create new tasks. When the **scheduleState** property has the value “OPERATIONAL”, the **scheduleState@currentErrors** property MUST be empty. The list of error codes are listed in the recordSchedule error code section.

Default Value: N/A – Output only.

Sort Order: Sequenced Numeric.

Input: N/A.

Output: The current setting.

B.9.1.2.1 allowedValueList for the **scheduleState@currentErrors** Property

Table B-29: allowedValueList for the **scheduleState@currentErrors** Property

<table>
<thead>
<tr>
<th>Value</th>
<th>R/O</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0-99</td>
<td>N/A</td>
<td>Reserved</td>
</tr>
<tr>
<td>100</td>
<td>R</td>
<td>General error – an error is detected but the cause can not be identified.</td>
</tr>
<tr>
<td>101</td>
<td>O</td>
<td>The number of spawned recordTask instances has reached some device dependent limit.</td>
</tr>
<tr>
<td>102</td>
<td>O</td>
<td>EPG information not available.</td>
</tr>
<tr>
<td>103</td>
<td>O</td>
<td>recordSchedule is disabled by the user.</td>
</tr>
<tr>
<td>104</td>
<td>O</td>
<td>Insufficient memory – The system does not have enough system memory to create any additional recordTask instances.</td>
</tr>
<tr>
<td>105</td>
<td>O</td>
<td>General resource error – some system related resource is causing the recordSchedule to malfunction.</td>
</tr>
</tbody>
</table>
### B.9.2 abnormalTasksExist

**Namespace**: srs  
**Property Data Type**: xsd:boolean  
**Multi-Valued**: NO

**Description**: If this property is set to “1”, then that indicates that at least one abnormal `recordTask` exists for the `recordSchedule`. If this property is set to “0”, then no abnormal `recordTask` exists for the `recordSchedule`. A `recordTask` is considered abnormal if it reaches any state other than “IDLE,READY”, “ACTIVE,RECORDING,FROMSTART,OK” or “DONE,FULL”.

**Default Value**: N/A – Output only.

**Sort Order**: Boolean.

**Input**: N/A.

**Output**: The current setting.

### B.10 Statistics Properties

#### Table B-30: Statistics Properties

<table>

</tr>
<tr>
<td><code>totalCompletedRecordTasks</code></td>
<td>srs</td>
<td>xsd:unsignedInt</td>
<td>NO</td>
<td>Appendix B.10.3</td>
</tr>
</tbody>
</table>

#### B.10.1 currentRecordTaskCount

**Namespace**: srs  
**Property Data Type**: xsd:unsignedInt  
**Multi-Valued**: NO

**Description**: The `currentRecordTaskCount` property indicates the number of existing `recordTask` instances that are currently associated with a given `recordSchedule`. Previously generated `recordTask` instances that have finished recording and that have been (auto-)deleted by the ScheduledRecording service are not taken into account.

**Default Value**: N/A – Output only.

**Sort Order**: Numeric.

**Input**: N/A.

**Output**: The current setting.

#### B.10.2 totalCreatedRecordTasks

**Namespace**: srs  
**Property Data Type**: xsd:unsignedInt  
**Multi-Valued**: NO
**Description:** The `totalCreatedRecordTasks` property indicates how many `recordTask` instances have been created during the lifetime of the associated `recordSchedule`. This includes previously generated `recordTask` instances that have finished recording and that have been (auto-)deleted by the ScheduledRecording service.

**Default Value:** N/A – Output only.

**Sort Order:** Numeric.

**Input:** N/A.

**Output:** The current setting.

### B.10.3 `totalCompletedRecordTasks`

**Namespace:** srs  \hspace{1cm} **Property Data Type:** xsd:unsignedInt  \hspace{1cm} **Multi-Valued:** NO

**Description:** The `totalCompletedRecordTasks` property indicates how many `recordTask` instances have been completed (that is: reached any of the “DONE.xxx” states, during the lifetime of the associated `recordSchedule`). This includes previously generated `recordTask` instances that have finished recording and that have been (auto-)deleted by the ScheduledRecording service.

**Default Value:** N/A – Output only.

**Sort Order:** Numeric.

**Input:** N/A.

**Output:** The current setting.

### B.11 Task General Properties

**Table B-31: Task General Properties**

<table>

</tr>
<tr>
<td><code>recordedCDSObjectID@link</code></td>
<td>srs</td>
<td>xsd:string</td>
<td>NO</td>
<td>Appendix B.11.2.1</td>
</tr>
</tbody>
</table>

### B.11.1 `recordScheduleID`

**Namespace:** srs  \hspace{1cm} **Property Data Type:** xsd:string  \hspace{1cm} **Multi-Valued:** NO

**Description:** The `recordScheduleID` property contains the value of the `@id` property of the `recordSchedule` that generated the `recordTask`.

**Default Value:** N/A – Output only.

**Sort Order:** Lexical or Lexical Numeric.

Each implementation SHOULD use the sort method most appropriate for its method of generating `@id` values. If `@id` values contain a numeric (sub)string that contains values that increment with each new object creation, then use Lexical Numeric; otherwise, use Lexical.

**Input:** N/A.

**Output:** The current setting.
B.11.2 **recordedCDSObjectID**

Namespace: srs  
Property Data Type: xsd:string  
Multi-Valued: **NO**

Description: The **recordedCDSObjectID** property contains the **didl-lite:@id** property value of the ContentDirectory service object that represents the content recorded by the **recordTask**.

Default Value: N/A – Output only.

Sort Order: Lexical or Lexical Numeric.

Each implementation SHOULD use the sort method most appropriate for its method of generating **didl-lite:@id** values. If **didl-lite:@id** values contain a numeric (sub)string that contains values that increment with each new object creation, then use Lexical Numeric; otherwise, use Lexical.

Input: N/A.

Output: The current setting.

B.11.2.1 **recordedCDSObjectID@link**

Namespace: srs  
Property Data Type: xsd:string  
Multi-Valued: **NO**

Description: The **recordedCDSObjectID@link** contains a unique, vendor-defined link identifier that unambiguously links its **recordedCDSObjectID** property to a particular **cdsReference** property instance within the same **recordTask** object. See Appendix B.17, “ContentDirectory Service Imported Properties” for details.

Default Value: N/A – Output only.

Sort Order: Same as **cdsReference@link** property.

Input: N/A.

Output: The current setting.

### B.12 Task Content Identification Properties

</tbody>
</table>

B.12.1 **taskCDSObjectID**

- **Namespace**: srs
- **Property Data Type**: xsd:string
- **Multi-Valued**: NO

**Description**: The taskCDSObjectID property contains the didl-lite@id property value of the ContentDirectory service object from which relevant metadata information was extracted to create the recordSchedule that generated this recordTask.

**Default Value**: N/A – Output only.

**Sort Order**: Lexical or Lexical Numeric.

Each implementation SHOULDS use the sort method most appropriate for its method of generating didl-lite:@id values. If didl-lite:@id values contain a numeric (sub)string that contains values that increment with each new object creation, then use Lexical Numeric; otherwise, use Lexical.

**Input**: N/A.

**Output**: The current setting.

B.12.1.1 **taskCDSObjectID@link**

- **Namespace**: srs
- **Property Data Type**: xsd:string
- **Multi-Valued**: NO

**Description**: The taskCDSObjectID@link contains a unique, vendor-defined link identifier that unambiguously links its taskCDSObjectID property to a particular cdsReference property instance within the same recordTask object. See Appendix B.17, “ContentDirectory Service Imported Properties” for details.

**Default Value**: N/A – Output only.

**Sort Order**: Same as cdsReference@link property.

**Input**: N/A.

**Output**: The current setting.

B.12.2 **taskChannelID**

- **Namespace**: srs
- **Property Data Type**: xsd:string
- **Multi-Valued**: NO

**Description**: The taskChannelID property indicates the actual channel that is used for the recording. Its format depends on the taskChannelID@type property. The possible formats and the dependency on the taskChannelID@type property are identical to the possible formats of the scheduledChannelID and its dependency on the scheduledChannelID@type property as described in Appendix B.4.2, “scheduledChannelID” and Appendix B.4.2.1, “scheduledChannelID@type”.

**Default Value**: N/A – Output only.

**Sort Order**: Same as scheduledChannelID property.

**Input**: N/A.

**Output**: The current setting.

B.12.2.1 **taskChannelID@type**

- **Namespace**: srs
- **Property Data Type**: xsd:string
- **Multi-Valued**: NO
**Description:** The `taskChannelID@type` property determines the format that is used for the `taskChannelID` property as defined above. See Appendix B.4.2.1, “`scheduledChannelID@type`” for details and allowed values.

**Default Value:** N/A – Output only.

**Sort Order:** Same as `scheduledChannelID@type` property.

**Input:** N/A.

**Output:** The current setting.

**B.12.2.2  `taskChannelID@distriNetworkName`**

---

**Namespace:** srs  
**Property Data Type:** xsd:string  
**Multi-Valued:** NO

**Description:** The `taskChannelID@distriNetworkName` property definition is identical to the `scheduledChannelID@distriNetworkName` property definition. See Appendix B.4.2.2, “`scheduledChannelID@distriNetworkName`” for details.

**Default Value:** N/A – Output only.

**Sort Order:** Same as `scheduledChannelID@distriNetworkName` property.

**Input:** N/A.

**Output:** The current setting.

**B.12.2.3  `taskChannelID@distriNetworkID`**

---

**Namespace:** srs  
**Property Data Type:** xsd:string  
**Multi-Valued:** NO

**Description:** The `taskChannelID@distriNetworkID` property definition is identical to the `scheduledChannelID@distriNetwork` property definition. See Appendix B.4.2.3, “`scheduledChannelID@distriNetworkID`” for details.

**Default Value:** N/A – Output only.

**Sort Order:** Same as `scheduledChannelID@distriNetworkID` property.

**Input:** N/A.

**Output:** The current setting.

**B.12.3  `taskStartDateTime`**

---

**Namespace:** srs  
**Property Data Type:** xsd:string  
**Multi-Valued:** NO

**Description:** The `taskStartDateTime` property indicates the actual start date&time (based on the current information) of the recording. This date&time does not include any adjustments. These are reflected in the `taskStartDateTimeAdjust` property. The date-time format syntax of the `taskStartDateTime` property is defined in Appendix D, “EBNF Syntax Definitions”.

**Default Value:** N/A – Output only.

**Sort Order:** Property Specific, in chronological order.

**Input:** N/A.

**Output:** The current setting.
B.12.4  **taskDuration**

**Namespace**: srs  
**Property Data Type**: xsd:string  
**Multi-Valued**: NO

**Description**: The *taskDuration* property indicates the actual duration (based on the current information) of the recording. This duration does not include any adjustments. These are reflected in the *taskDurationAdjust* property. The duration format syntax of the *taskDuration* property is defined in Appendix D, “EBNF Syntax Definitions”.

**Default Value**: N/A – Output only.

**Sort Order**: Property Specific, based on elapsed time. Ascending: shortest elapsed time first.

**Input**: N/A.

**Output**: The current setting.

B.12.5  **taskProgramCode**

**Namespace**: srs  
**Property Data Type**: xsd:string  
**Multi-Valued**: NO

**Description**: The *taskProgramCode* property indicates the actual program code that is used for the recording. The format is identical to the format of the *scheduledProgramCode* property. See Appendix B.4.5, “*scheduledProgramCode*” for details.

**Default Value**: N/A – Output only.

**Sort Order**: Sorting on this property is meaningless and will be ignored.

**Input**: N/A.

**Output**: The current setting.

B.12.5.1  **taskProgramCode@type**

**Namespace**: srs  
**Property Data Type**: xsd:string  
**Multi-Valued**: NO

**Description**: The *taskProgramCode@type* property indicates the type of the program guide service that defines the program code specified in the *taskProgramCode* property. The format is identical to the format of the *scheduledProgramCode@type* property. See Appendix B.4.5.1, “*scheduledProgramCode@type*” for details.

**Default Value**: N/A – Output only.

**Sort Order**: Sorting on this property is meaningless and will be ignored.

**Input**: N/A.

**Output**: The current setting.

B.12.6  **recordQuality**

**Namespace**: srs  
**Property Data Type**: xsd:string  
**Multi-Valued**: YES

**Description**: The *recordQuality* property expresses the recording quality level that is used for a particular *recordTask*.

When the *recordTask* is in the “IDLE” phase (the actual recording has not started yet), this property contains a best-known estimate of the recording quality for the recording. Therefore, the *recordQuality* property MUST contain one of the vendor-defined values supported by the ScheduledRecording service. The value “AUTO” is not allowed. If the implementation does not have enough information to generate a value with some accuracy, then the value “UNKNOWN” MUST be used.
When the `recordTask` is in the "ACTIVE" or "DONE" phase, the `recordQuality` property MUST contain one of the values supported by the implementation, that describes the actual recording quality. The values "AUTO" and "UNKNOWN" are not allowed.

There are many ways to express recording quality. Some implementations use bitrates, some use user-friendly labels etc. Some implementations might even support multiple ways to express recording quality simultaneously. The `recordQuality` property is used in conjunction with the `recordQuality@type` to allow implementations to express these type variations.

For each type variation, the allowed values for the `recordQuality` property MUST be the same as the allowed values supported for the corresponding type variation of the `desiredRecordQuality` property, except that "UNKNOWN" replaces "AUTO".

Note that the `recordQuality` property is a multi-valued property. Therefore, the actual recording quality level can be expressed using different type variations simultaneously. As a baseline, all implementations MUST support type variation "DEFAULT". All record quality levels expressed in a certain type variation MUST have equivalent quality levels expressed in all other type variations, supported by the implementation. If an implementation supports multiple type variations to express recording quality, then it MUST provide the recording quality level expressed in all supported type variations.

**Example:** Assume a (hypothetical) implementation that supports the type variations "DEFAULT", "ATSC" and "QLEVEL" for the `recordQuality@type` property. The following table expresses the supported `recordQuality` property values for those variations and also indicates how the different type variations interrelate for this particular implementation:

<table>
<thead>
<tr>
<th>&quot;DEFAULT&quot;</th>
<th>&quot;ATSC&quot;</th>
<th>&quot;QLEVEL&quot;</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;HD&quot;</td>
<td>&quot;1080p30&quot;</td>
<td>&quot;Q1&quot;</td>
</tr>
<tr>
<td></td>
<td>&quot;1080p24&quot;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>&quot;1080i60&quot;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>&quot;720p60&quot;</td>
<td>&quot;Q2&quot;</td>
</tr>
<tr>
<td></td>
<td>&quot;720p30&quot;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>&quot;720p24&quot;</td>
<td></td>
</tr>
<tr>
<td>&quot;ED&quot;</td>
<td>&quot;480p60&quot;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>&quot;480p30&quot;</td>
<td>&quot;Q3&quot;</td>
</tr>
<tr>
<td></td>
<td>&quot;480p24&quot;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>&quot;480i60&quot;</td>
<td></td>
</tr>
<tr>
<td>&quot;UNKNOWN&quot;</td>
<td>&quot;UNKNOWN&quot;</td>
<td>&quot;UNKNOWN&quot;</td>
</tr>
</tbody>
</table>

- Assuming the actual recording quality of a `recordTask` is "720p60" (as an example), then the `recordTask` object MUST include three instances of the `recordQuality` property as illustrated by the following XML fragment:

```
xrecordQuality type="DEFAULT">HD</recordQuality>
<recordQuality type="ATSC">720p60</recordQuality>
<recordQuality type="QLEVEL">Q2</recordQuality>
```

- Assuming the actual recording quality of a `recordTask` is "480p60", then the `recordTask` object MUST include three instances of the `recordQuality` property as illustrated by the following XML fragment:

```
xrecordQuality type="DEFAULT">HD</recordQuality>
<recordQuality type="ATSC">720p60</recordQuality>
<recordQuality type="QLEVEL">Q2</recordQuality>
```

© 2013, UPnP Forum. All rights Reserved.
When the ScheduledRecording service responds to a `GetAllowedValues()` action with `recordQuality` information, then the allowed values MUST be listed in order of quality from highest quality to lowest.

**Default Value:** N/A – Output only.

**Sort Order:** type Relationship.

**Input:** N/A.

**Output:** The current setting.

### B.12.6.1 allowedValueList for the `recordQuality` Property

Table B-34: allowedValueList for the `recordQuality` Property

<table>
<thead>
<tr>
<th>Value</th>
<th>R/O</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;UNKNOWN&quot;</td>
<td>R</td>
<td>The recording quality is unknown by the ScheduledRecording service. Only applicable when the <code>recordTask</code> is in the “IDLE” phase.</td>
</tr>
<tr>
<td>Vendor-defined</td>
<td>X</td>
<td></td>
</tr>
</tbody>
</table>

### B.12.6.2 `recordQuality@type`

**Namespace:** srs  
**Property Data Type:** xsd:string  
**Multi-Valued:** NO

**Description:** There are many ways to express recording quality. Some implementations use bitrates, some use user-friendly labels etc. Some implementations might even support multiple ways to express recording quality simultaneously. The `recordQuality@type` property is used to express which type variation is used in its associated independent `recordQuality` property. The “DEFAULT” value MUST be supported.

**Default Value:** N/A – Output only.

**Sort Order:** Sorting on this property is meaningless and will be ignored.

**Input:** N/A.

**Output:** The current setting.

### B.13 Task Matched Content Criteria Properties

Table B-35: Task Matched Content Criteria Properties

</tbody>
</table>

### B.13.1 `matchedName`

**Namespace:** srs  
**Property Data Type:** xsd:string  
**Multi-Valued:** NO

© 2013, UPnP Forum. All rights Reserved.
Description: The `matchedName` property contains the full matched name of a program or series. This is the full program or series name of the external item that (partially) matched the name specified in the `matchingName` property of the `recordSchedule`.

Default Value: N/A – Output only.

Sort Order: Same as `matchingName` property.

Input: N/A.

Output: The current setting.

**B.13.1.1 matchedName@type**

Namespace: srs  
Property Data Type: xsd:string  
Multi-Valued: NO

Description: IF set to “PROGRAM”, then the `matchedName` property contains a program name. If set to “SERIES”, then the `matchedName` property contains a series name. The format is identical to the format of the `matchingName@type` property. See Appendix B.5.1.1, “matchingName@type” for details.

Default Value: N/A – Output only.

Sort Order: Same as `matchedName@type` property.

Input: N/A.

Output: The current setting.

**B.13.2 matchedID**

Namespace: srs  
Property Data Type: xsd:string  
Multi-Valued: NO

Description: The `matchedID` property contains the matched ID of a program or series. This is the ID of the external item that matched the ID specified in the `matchingID` property of the `recordSchedule`. The format is identical to the format of the `matchedID@type` property.

Default Value: N/A – Output only.

Sort Order: Sorting on this property is meaningless and will be ignored.

Input: N/A.

Output: The current setting.

**B.13.2.1 matchedID@type**

Namespace: srs  
Property Data Type: xsd:string  
Multi-Valued: NO

Description: The `matchedID@type` property indicates the type of the ID that is contained in the `matchedID` property. The format of this property is identical to the format of the `matchedID@type` property.

Default Value: N/A – Output only.

Sort Order: Sorting on this property is meaningless and will be ignored.

Input: N/A.

Output: The current setting.
### B.14 Task Matched Qualifying Criteria Properties

#### Table B-36: Task Matched Qualifying Criteria Properties

<table>
<thead>
<tr>

<td>Appendix B.14.4</td>
</tr>
</tbody>
</table>

#### B.14.1 matchedRating

**Namespace:** srs  
**Property Data Type:** xsd:string  
**Multi-Valued:** YES

**Description:** The `matchedRating` property contains the actual rating of the recording. This is the rating of the external item that matched (was less or equal to) a rating limit specified in one of the `matchingRatingLimit` properties of the `recordSchedule`. The format is identical to the format of the `matchingRatingLimit` property. See Appendix B.6.4, "matchingRatingLimit" for details.

**Default Value:** N/A – Output only.

**Sort Order:** Same as `matchingRatingLimit` property.

**Input:** N/A.

**Output:** The current setting.

#### B.14.2 matchedRating@type

**Namespace:** srs  
**Property Data Type:** xsd:string  
**Multi-Valued:** NO

**Description:** The `matchedRating@type` property indicates the rating system used in the `matchedRating` property. The format is identical to the format of the `matchingRatingLimit@type` property. See Appendix B.6.4.2, "matchingRatingLimit@type" for details.

**Default Value:** N/A – Output only.

**Sort Order:** Same as `matchingRatingLimit@type` property.

**Input:** N/A.

**Output:** The current setting.

#### B.14.3 matchedRating@equivalentAge

**Namespace:** srs  
**Property Data Type:** xsd:string  
**Multi-Valued:** NO

**Description:** The `matchedRating@equivalentAge` property indicates the equivalent age rating used in the `matchedRating` property. The format is identical to the format of the `matchingRatingLimit@equivalentAge` property. See Appendix B.6.4.3, "matchingRatingLimit@equivalentAge" for details.

**Default Value:** N/A – Output only.

**Sort Order:** Same as `matchingRatingLimit@equivalentAge` property.

**Input:** N/A.

**Output:** The current setting.
B.14.4  matchedEpisodeType

Namespace: srs  Property Data Type: xsd:string  Multi-Valued: NO

Description: The matchedEpisodeType property contains the actual episode type of the recording. This is the episode type of the external item that matched episode type specified in the matchingEpisodeType property of the recordSchedule. The format is identical to the format of the matchingEpisodeType property. See Appendix B.6.5, “matchingEpisodeType” for details.

Default Value: N/A – Output only.

Sort Order: Same as matchingEpisodeType property.

Input: N/A.

Output: The current setting.

B.15 Task Matched Content Control Properties

Table B-37: Task Matched Content Control Properties

B.15.1  taskStartDateTimeAdjust

Namespace: srs  Property Data Type: xsd:string  Multi-Valued: NO

Description: The taskStartDateTimeAdjust property is set to the value of the scheduledStartDateTimeAdjust property of the parent recordSchedule. The format is identical to the format of the scheduledStartDateTimeAdjust property. See Appendix B.7.2, “scheduledStartDateTimeAdjust” for details.

Default Value: N/A – Output only.

Sort Order: Same as scheduledStartDateTimeAdjust property.

Input: N/A.

Output: The current setting.

B.15.2  taskDurationAdjust

Namespace: srs  Property Data Type: xsd:string  Multi-Valued: NO

Description: The taskDurationAdjust property is set to the value of the scheduledDurationAdjust property of the parent recordSchedule. The format is identical to the format of the scheduledDurationAdjust property. See Appendix B.7.3, “scheduledDurationAdjust” for details.

Default Value: N/A – Output only.

Sort Order: Same as scheduledDurationAdjust property.
Input: N/A.
Output: The current setting.

B.15.3 **taskDurationLimit**

Namespace: srs  
Property Data Type: xsd:string  
Multi-Valued: **NO**

The `taskDurationLimit` property is set to the value of the `durationLimit` property of the parent `recordSchedule`. The format is identical to the format of the `durationLimit` property. See Appendix B.7.5, "durationLimit" for details.

Default Value: N/A – Output only.

Sort Order: Same as `durationLimit` property.

Input: N/A.
Output: The current setting.

B.15.4 **taskDurationLimit@effect**

Namespace: srs  
Property Data Type: xsd:string  
Multi-Valued: **NO**

The `taskDurationLimit@effect` property is set to the value of the `durationLimit@effect` property of the parent `recordSchedule`. The format is identical to the format of the `durationLimit@effect` property. See Appendix B.7.5.1, "durationLimit@effect" for details.

Default Value: N/A – Output only.

Sort Order: Same as `durationLimit@effect` property.

Input: N/A.
Output: The current setting.

B.15.5 **taskChannelMigration**

Namespace: srs  
Property Data Type: xsd:boolean  
Multi-Valued: **NO**

Description: The `taskChannelMigration` property is set to the value of the `channelMigration` property of the parent `recordSchedule`. The format is identical to the format of the `channelMigration` property. See Appendix B.7.6, "channelMigration" for details.

Default Value: N/A – Output only.

Sort Order: Same as `channelMigration` property.

Input: N/A.
Output: The current setting.

B.15.6 **taskTimeMigration**

Namespace: srs  
Property Data Type: xsd:boolean  
Multi-Valued: **NO**

Description: The `taskTimeMigration` property is set to the value of the `timeMigration` property of the parent `recordSchedule`. The format is identical to the format of the `timeMigration` property. See Appendix B.7.7, "timeMigration" for details.

Default Value: N/A – Output only.

Sort Order: Same as `timeMigration` property.
Input: N/A.

Output: The current setting.

B.16.1 taskState

Namespace: srs  Property Data Type: xsd:string  Multi-Valued: NO

Description: The taskState property indicates the overall state of the recordTask.

Default Value: N/A – Output only.

Sort Order: Property Specific, based on the order in Table B-39. Ascending: first table entry first.

Input: N/A.

Output: The current setting.

B.16.1.1 allowedValueList for the taskState Property

This section defines the normative allowed values for the taskState property. Each of these values represents a semantically meaningful combination of values for some of the “low-level” state properties (that is: taskState@xxx). Although it is possible to derive the value of the taskState property from some of the “low-level” taskState@xxx properties, the taskState property provides a more convenient mechanism to determine the current state of the recordTask.

The definition of each state is shown in the table below. This table represents the normative definitions of the various states. Although some of the low-level state properties have been declared as optional, their underlying semantics and their significance towards the definition of each valid taskState value is not
diminished. Regardless of whether or not a given device is able to expose all of the low-level state properties, every device has a conceptual notion of property semantics. For example, some devices may not be able to support the `taskState@lastBitsRecorded` property, however, even these devices have an internal concept that the last bits of the content have or have not been recorded.

In some cases, a specific low-level state property does not contribute to the definition of a given state. In other words, the low-level property can have any value without affecting the semantics of the state. This situation is indicated by a “-” in the table entry.

The “Ø” symbol is used to indicate an empty attribute. The “{}” symbol is used when the attribute is not empty.

Following this table, a more intuitive informational description of each state value and their support level is described.

**Table B-39: allowedValueList for the `taskState` Property**

B.16.1.2  *taskState@phase*

<table>
<thead>
<tr>
<th>Value</th>
<th>R/O</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“DONE.EMPTY”</td>
<td>R</td>
<td>The <em>recordTask</em> has reached its final disposition and no other property or attribute changes will occur. No content has been recorded at all due to error conditions.</td>
</tr>
</tbody>
</table>

**Namespace:** srs  
**Property Data Type:** xsd:string  
**Multi-Valued:** NO

**Description:** The *taskState@phase* property indicates the current phase of a *recordTask* within its normal lifetime. The following allowed values for this property are sequentially assigned at the appropriate points in time within the *recordTask*’s normal lifetime: “IDLE” → “ACTIVE” → “DONE”. In certain cases, some of the phase values may be skipped, for example, when a fatal error is detected.

**Default Value:** N/A – Output only.

**Sort Order:** Property Specific, based on the order in Table B-41. Ascending: first table entry first.

**Input:** N/A.

**Output:** The current setting.

B.16.1.2.1  allowedValueList for the *taskState@phase* Property

**Table B-41: allowedValueList for the *taskState@phase* Property**

<table>
<thead>
<tr>
<th>Value</th>
<th>R/O</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“IDLE”</td>
<td>R</td>
<td>Indicates that the <em>recordTask</em>’s start time has not yet been reached.</td>
</tr>
<tr>
<td>“ACTIVE”</td>
<td>R</td>
<td>Indicates that the <em>recordTask</em> is in between the “IDLE” and “DONE” phases. Typically, the <em>recordTask</em>’s content is (partially) available and an attempt is made to record the remaining content.</td>
</tr>
<tr>
<td>“DONE”</td>
<td>R</td>
<td>Indicates that the <em>recordTask</em>’s final disposition has been reached. For example, the <em>recordTask</em>’s end time has been reached or a fatal error has occurred. Once the device reaches this phase, no additional state changes occur.</td>
</tr>
</tbody>
</table>

B.16.1.3  *taskState@startDateTimeMet*

<table>
<thead>
<tr>
<th>Value</th>
<th>R/O</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>“DONE”</td>
<td>R</td>
<td>Indicates the <em>recordTask</em>’s actualStartDateTime has reached the “DONE” phase. For example, if the <em>recordTask</em> terminates prematurely (that is: reaches the “DONE” phase before the start time is reached, for example, due to a fatal error), this property is not updated.</td>
</tr>
</tbody>
</table>

© 2013, UPnP Forum. All rights Reserved.
Default Value: N/A – Output only.
Sort Order: Boolean.
Input: N/A.
Output: The current setting.

B.16.1.4  **taskState@endDateTimeMet**

Namespace: srs  
Property Data Type: xsd:boolean  
Multi-Valued: NO

Description: The `taskState@endDateTimeMet` property indicates whether the `recordTask`’s `actualEndDateTime` has been reached. See Section 2.2, “Terms” for the definition of `actualEndDateTime`.

If a `recordTask` has reached the “DONE” phase, this property indicates the last status before the `recordTask` has reached the “DONE” phase. Note: if the `recordTask` terminates prematurely (that is: reaches the “DONE” phase before the end time is reached, for example, due to a fatal error), this property is not updated.

Default Value: N/A – Output only.
Sort Order: Boolean.
Input: N/A.
Output: The current setting.

B.16.1.5  **taskState@recording**

Namespace: srs  
Property Data Type: xsd:boolean  
Multi-Valued: NO

Description: The `taskState@recording` property indicates whether one of the device’s record destinations is currently recording the content identified by the `recordTask`.

Default Value: N/A – Output only.
Sort Order: Boolean.
Input: N/A.
Output: The current setting.

B.16.1.6  **taskState@someBitsRecorded**

Namespace: srs  
Property Data Type: xsd:boolean  
Multi-Valued: NO

Description: The `taskState@someBitsRecorded` property indicates whether some portion of the content identified by the `recordTask` has been recorded.

Default Value: N/A – Output only.
Sort Order: Boolean.
Input: N/A.
Output: The current setting.

B.16.1.7  **taskState@someBitsMissing**

Namespace: srs  
Property Data Type: xsd:boolean  
Multi-Valued: NO
Description: The taskState@someBitsMissing property indicates whether some portion of the content identified by the recordTask has not been recorded. This property will be “0” as long as all the bits that have been available so far have also been recorded.

Default Value: N/A – Output only.

Sort Order: Boolean.

Input: N/A.

Output: The current setting.

B.16.1.8  taskState@firstBitsRecorded

Namespace: srs  Property Data Type: xsd:boolean  Multi-Valued: NO

Description: The taskState@firstBitsRecorded property indicates whether the first portion of the content identified by the recordTask has been recorded.

Default Value: N/A – Output only.

Sort Order: N/A – Output only.

Input: N/A.

Output: The current setting.

B.16.1.9  taskState@lastBitsRecorded

Namespace: srs  Property Data Type: xsd:boolean  Multi-Valued: NO

Description: The taskState@lastBitsRecorded property indicates whether the ending portion of the content identified by the recordTask has been recorded.

Default Value: N/A – Output only.

Sort Order: Boolean.

Input: N/A.

Output: The current setting.

B.16.1.10  taskState@fatalError

Namespace: srs  Property Data Type: xsd:boolean  Multi-Valued: NO

Description: The taskState@fatalError property indicates whether a fatal error has occurred. A fatal error is defined to be an error condition that causes the recordTask to terminate before its actualEndDateTime has been reached.

Default Value: N/A – Output only.

Sort Order: Boolean.

Input: N/A.

Output: The current setting.

B.16.1.11  taskState@currentErrors

Namespace: srs  Property Data Type: CSV (xsd:int)  Multi-Valued: NO

Description: The taskState@currentErrors property identifies the CSV list of errors that are currently preventing the recordTask from recording. An empty CSV list indicates that there are no errors currently
blocking the recording. Multiple errors are listed in order of occurrence starting with the oldest error and ending with the most recent.

When the errors are not resolved before reaching the “DONE” phase, they MAY be persisted in the “DONE” phase. If a device persists current errors, the value of this property MUST be set to the value that this property had immediately prior to entering the “DONE” phase. If a device does not persist current errors, the taskState@currentErrors MUST be empty in the “DONE” phase.

By definition, this property MUST be empty while in the “IDLE” phase. The current errors are also copied to the taskState@errorHistory property.

Default Value: N/A – Output only.

Sort Order: Sequenced Numeric.

Input: N/A.

Output: The current setting.

B.16.1.11.1 allowedValueList for the taskState@currentErrors Property and Other Error Properties

The following table defines error codes for all error properties of a recordTask, such as taskState@currentErrors, taskState@errorHistory, etc. to expose error conditions. This error list can be extended in the future or by vendors. The errors are grouped into separate categories and labeled 1xx, 2xx, 3xx, and 4xx groups, each group representing the nature of errors; that is: general errors, media errors, system errors and content errors, respectively. The grouping of error codes allows a control point to be able to understand the nature of errors when an unknown error code (that is: extended specification or vendor extended) is encountered. For example, if an unknown error is labeled 3xx, it can be interpreted by the control point as 300.

Table B-42: allowedValueList for the taskState@xxx Properties

<table>
<thead>
<tr>

404 | O | Content Rescheduled - the originally scheduled content has been preempted.
405-449 | N/A | Reserved for future Content Error Codes.
450-499 | N/A | Reserved for vendor-defined Content Error Codes.
500 and above | N/A | Reserved for future new category information extensions.

### B.16.1.12 taskState@errorHistory

**Namespace**: srs  
**Property Data Type**: CSV (xsd:int)  
**Multi-Valued**: NO  

**Description**: The `taskState@errorHistory` property identifies the CSV list of errors that have (at any time) prevented the `recordTask` from completing successfully. This includes both past and current recording errors. Multiple errors are listed in order of occurrence starting with the oldest error and ending with the most recent. An empty list indicates that none of the `recordTask`’s content has yet been prevented from being recorded. By definition, this list will always be empty while in the “IDLE” phase. Note: Any errors listed in `taskState@currentErrors` MUST also be copied to and persisted in this property.

**Default Value**: N/A – Output only.

**Sort Order**: Sequenced Numeric.

**Input**: N/A.

**Output**: The current setting.

### B.16.1.12.1 allowedValueList for the `taskState@errorHistory` Property

See Appendix B.16.1.11.1, “allowedValueList for the `taskState@currentErrors` Property” for details.

### B.16.1.13 taskState@pendingErrors

**Namespace**: srs  
**Property Data Type**: CSV (xsd:int)  
**Multi-Valued**: NO  

**Description**: The `taskState@pendingErrors` property identifies the CSV list of errors that may prevent the `recordTask` from completing successfully at some time in the future unless resolved. An empty CSV list means that no pending errors have been detected. The list of errors that the device is able to detect before they actually occur may be obtained via the `GetAllowedValues()` action.

Those devices that are not able to detect any pending errors before they actually occur MAY always return an empty list for the value of this property. In this case, the value returned by `GetAllowedValues()` for this property MUST also be an empty list.

If any of these pending errors actually occur, they MUST be added to the `taskState@currentErrors` list and `taskState@errorHistory` and removed from this list. When the pending errors did not occur, these errors MAY be persisted to the “DONE” phase. If a device does not persist any pending errors that have not occurred yet, then the `taskState@pendingErrors` MUST be empty in the “DONE” phase. Otherwise the value of this property MUST be set to the value that this property had immediately prior to entering the “DONE” phase.

**Default Value**: N/A – Output only.

**Sort Order**: Sequenced Numeric.

**Input**: N/A.

**Output**: The current setting.
B.16.1.13.1  allowedValueList for the taskState@pendingErrors Property
See Appendix B.16.1.11.1, “allowedValueList for the taskState@currentErrors Property” for details.

B.16.1.14  taskState@infoList
Namespace: srs   Property Data Type: CSV (xsd:int)   Multi-Valued: NO
Description: The taskState@infoList property identifies the CSV list of additional conditions that have been detected but will not block the current recordTask, for example, conflict winner.
The list of possible information that the device is able to detect may be obtained via the GetAllowedValues() action.
Devices that are not able to detect any additional information MUST always return an empty list. In this case, the value returned by GetAllowedValues() for this property MUST also be an empty list.
Note: a device can also use additionalStatusInfo to expose information in text format.
Default Value: N/A – Output only.
Sort Order: Sequenced Numeric.
Input: N/A.
Output: The current setting.

B.16.1.14.1  allowedValueList for the taskState@infoList Property
See Appendix B.16.1.11.1, “allowedValueList for the taskState@currentErrors Property” for details.

B.17  ContentDirectory Service Imported Properties
ContentDirectory service properties are imported through the cdsReference multi-valued property. The main reason to import properties (metadata) from ContentDirectory service objects into a recordSchedule or recordTask object is to make that object self-contained; that is: a control point can retrieve relevant metadata from the ScheduledRecording service object without having to first extract the object IDs of external ContentDirectory service objects and then retrieve the metadata from these objects via additional actions. In addition, even when the referenced object in the ContentDirectory service is deleted, its metadata is still preserved within the ScheduledRecording service. It is the responsibility of the device to maintain consistency between the actual ContentDirectory service object’s metadata and the metadata contained in the corresponding cdsReference property.
The cdsReference property MUST contain a valid (it MUST contain all the REQUIRED properties as dictated by the DIDL-Lite Schema; also, if dependent properties are imported, their independent properties MUST be imported as well.) and properly escaped DIDL-Lite XML Document as defined in the ContentDirectory service specification. (Care must be taken to correctly define namespaces.)
The DIDL-Lite XML Document describes a device-dependent (sub)set of imported properties (metadata) of the ContentDirectory service object that is referenced by the linked xxxCDSObjectID property. The information contained in the DIDL-Lite XML Document MUST exactly match the DIDL-Lite XML Document that would be returned in the Result argument of the ContentDirectory::Browse() action with its input arguments set as follows:
ObjectID: The linked xxxCDSObjectID property value.
BrowseFlag: Set to “BrowseMetaData”.
Filter: Set to the list of property names that are imported from the ContentDirectory service by the ScheduledRecording service.
StartingIndex: 0.
RequestedCount: 0.
SortCriteria: "", the empty string.

The following example illustrates the possible content of a \textit{cdsReference} property in the context of a \textit{recordSchedule} object (expressed in XML).

```xml
<?xml version="1.0" encoding="UTF-8"?>
<rs xmlns="urn:schemas-upnp-org:av:srs"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="urn:schemas-upnp-org:av:srs
http://www.upnp.org/schemas/av/srs.xsd">
  <item id="sched001">
    <class>OBJECT.RECORDSCHEDULE.DIRECT.CDSEPG</class>
    <title>My Schedule</title>
    ...
  </item>
  <scheduledCDSObjectID link="schedObj001">
    epg001
  </scheduledCDSObjectID>
  ...
  <cdsReference link="schedObj001">
    <!-- The following \textit{DIDL-Lite} XML Document needs to be interpreted as a simple string and therefore needs to be properly escaped -->
    &lt;?xml version="1.0" encoding="UTF-8"?&gt;
    &lt;DIDL-Lite
    xmlns:dc="http://purl.org/dc/elements/1.1/
    xmlns:upnp="urn:schemas-upnp-org:metadata-1-0/upnp/
    xmlns="urn:schemas-upnp-org:metadata-1-0/DIDL-Lite/
    \&lt;item id="epg001" parentID="container007"
    restricted="0"&gt;
    \&lt;dc:title&gt;Friends\&lt;/dc:title&gt;
    \&lt;upnp:class&gt;
    object.item.epgItem.videoProgram
    \&lt;/upnp:class&gt;
    ...
    \&lt;/item&gt;
    \&lt;/DIDL-Lite&gt;
    <!-- End of \textit{DIDL-Lite} XML Document -->
    </cdsReference>
    ...
</item>
</rs>
```
The next example illustrates the possible content of two `cdsReference` property instances relating to the `taskCDSObjectID` and `recordedCDSObjectID` property in the context of a `recordTask` object (expressed in XML).

```xml
<?xml version="1.0" encoding="UTF-8"?>
<srs
xmlns="urn:schemas-upnp-org:av:srs"
xm xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="urn:schemas-upnp-org:av:srs http://www.upnp.org/schemas/av/srs.xsd">
  <item id="Task001">
    <class>OBJECT.RECORDTASK</class>
    <title>My Task</title>
    ...
    <taskCDSObjectID link="tskObj001">
      epg001
    </taskCDSObjectID>
    ...
    <recordedCDSObjectID link="recObj001">
      rec001
    </recordedCDSObjectID>
    ...
    <cdsReference link="tskObj001">
      <![CDATA[<!--The following DIDL-Lite XML Document needs to be interpreted as a simple string and therefore needs to be properly escaped-->
      &lt;?xml version="1.0" encoding="UTF-8"?&gt;
      &lt;?DIDL-Lite
      xmlns:dc="http://purl.org/dc/elements/1.1/"
      xmlns:upnp="urn:schemas-upnp-org:metadata-1-0/upnp/"
      xmlns="urn:schemas-upnp-org:metadata-1-0/DIDL-Lite/"&gt;
      &lt;item id="epg001" parentID="container007"
      restricted="0"&gt;
        &lt;?dc:title>Friends&lt;/dc:title&gt;
        &lt;?upnp:class&gt;
          object.item.epgItem.videoProgram
        &lt;/upnp:class&gt;
        ...
        &lt;/item&gt;
      &lt;?/DIDL-Lite&gt;
      <![CDATA[<!--End of DIDL-Lite XML Document-->]]>
    </cdsReference>
    ...
    <cdsReference link="recObj001">
      <![CDATA[<!--The following DIDL-Lite XML Document needs to be interpreted as a simple string and therefore needs to be properly escaped-->
      &lt;?xml version="1.0" encoding="UTF-8"?&gt;
      &lt;?DIDL-Lite
      xmlns:dc="http://purl.org/dc/elements/1.1/"
      ...
    </cdsReference>
  </item>
</srs>
```
<?item id="rec001" parentID="cnt009" restricted="0">

    <upnp:class>object.item.videoItem</upnp:class>
    ...
</item>

</DIDL-Lite>

<!-- End of DIDL-Lite XML Document -->

</cdsReference>
Appendix C. AV Working Committee Class Definitions (Normative)

C.1 Class Hierarchy

The ScheduledRecording service exposes a class hierarchy which is used to type all objects that can be retrieved from it. Each class is named using a string of the form described in Appendix D.3, “Class Name Syntax” below.

For a particular class, some properties are REQUIRED, others are OPTIONAL and some are PROHIBITED.

A class that is derived from another class MUST include all of the member properties of the parent class. The definition of a derived class MAY make some optional properties of the base class REQUIRED.

Each class definition includes a list of properties. Each property is expressed in XML as either an XML Element or an XML Attribute. Some independent properties are multi-valued for a class, meaning that, in an XML instance of the class, the property may occur more than once.

This Appendix defines the base class object from which all other classes are derived. No object of this abstract class can be instantiated. From the object class, two classes are derived; the object.recordSchedule class and the object.recordTask class.

The abstract object.recordSchedule class and its two derived abstract classes object.recordSchedule.direct and object.recordSchedule.query make up the basic hierarchy from which all other recordSchedule classes are derived. These three classes can not be instantiated (no object can exist within the ScheduledRecording service that has its class property set to “OBJECT.RECORDSCHEDULE”, “OBJECT.RECORDSCHEDULE.DIRECT” or “OBJECT.RECORDSCHEDULE.QUERY”).

The object.recordTask class is used to type all recordTask objects in the ScheduledRecording service. The object.recordTask class has no derived classes defined yet.

In addition to these classes, a number of classes are derived from the object.recordSchedule.direct and object.recordSchedule.query classes. Figure 7 below shows the hierarchy of these classes.

![Figure 7: Class hierarchy for the ScheduledRecording service.](image)

Vendors MAY extend the functionality, provided by the standard record classes, by adding vendor-defined properties. Any device that adds a property whose description matches one of the AV Working Committee-defined property descriptions MUST use the AV Working Committee-defined property name.
In addition, any device that uses a property name from the ScheduledRecording service specification MUST use it with the same semantics as the AV Working Committee-defined description of that property. In order to accommodate vendor-defined properties, control points should gracefully ignore any properties whose names and semantics they do not understand.

When adding properties, it is RECOMMENDED that vendors create a vendor-defined derived class with a vendor-defined class name, rather than adding the properties to the existing standard class without creating a vendor-defined class. This provides a simple mechanism for control points to determine if a class has been extended by simply examining the class property value. In all cases, vendor-defined classes MUST remain fully compatible with the standard class from which they were derived. In other words, control points that do not understand the specifics of the vendor-defined additions should still be able to interact with an instance of the vendor-defined derived class object as if it were an instance of that standard class.

Vendor-defined classes MUST always be derived from standard classes that can be instantiated (the green-colored boxes in Figure 7). It is therefore PROHIBITED to derive vendor-defined classes directly from classes, such as “OBJECT.RECORDSCHEDULE”, “OBJECT.RECORDSCHEDULE.DIRECT”, and “OBJECT.RECORDSCHEDULE.QUERY”. It is allowed to derive vendor-defined classes from class “OBJECT.RECORDEVENT”. All standard classes and vendor-defined derived classes supported by a particular ScheduledRecording service implementation MUST be individually listed in the allowedValueList of the class property. (This list can be retrieved via the GetAllowedValues() action.) Implementations are REQUIRED to support all intermediate classes in a chain of derived classes. For example, if an implementation supports a vendor-defined class “OBJECT.RECORDSCHEDULE.DIRECT.CDSEPG.HDTV.LOCAL”, then it MUST also support the “OBJECT.RECORDSCHEDULE.DIRECT.CDSEPG.HDTV” and “OBJECT.RECORDSCHEDULE.DIRECT.CDSEPG” classes.

As indicated in Appendix D.3, “Class Name Syntax”, strict naming conventions MUST be followed when naming derived vendor-defined classes. Vendor-defined class names MUST be based on one of the instantiatable class names in this specification. Therefore, all vendor-defined class names MUST start with one of the string values, defined in Table B-2, “allowedValueList for the class Property”.

Control points that need to examine class property values, should be prepared to handle vendor-defined class names. Therefore, control points should never use simple string matching to determine the actual class of an object. Rather, they should parse the class name from left to right and determine if there is at least a left substring match with one of the string values defined in Table B-2, “allowedValueList for the class Property”. If such a match is found, the remaining characters in the class name can be examined for potential matches with vendor-defined class names of which the control point is aware. If no such match is found, the control point can treat the object as if it were an instance of the most specialized class for which a match was found.

C.1.1 Relationships between Classes and Properties

The following tables present a complete overview of all the defined properties and in which classes these properties are actually used (member properties).

For a particular class, some properties are REQUIRED, others are OPTIONAL and some are PROHIBITED. Every instance of a class MUST have a value for each supported REQUIRED or OPTIONAL member property of that class (see Section 2.2, “Terms”).

The support level of a member property defines how the member property MUST be used in the arguments of an action when that action is invoked. The support level of a member property can be different for recordSchedule, recordScheduleParts, and recordTask usage.

The recordScheduleParts support level for the specified class indicates the use of a member property when a control point requests to create a recordSchedule. If a member property is defined as REQUIRED for recordScheduleParts usage, an argument of type A_ARG_TYPE_RecordScheduleParts MUST contain...
that member property and the ScheduledRecording service MUST support it. If it is defined as
OPTIONAL, the ScheduledRecording service MAY support the member property and a control point may
specify or omit the member property in a request message even if the member property is supported by the
ScheduledRecording service. PROHIBITED or unsupported OPTIONAL member properties specified in
an argument of type \texttt{A\_ARG\_TYPE\_RecordScheduleParts} MUST be gracefully ignored by the
ScheduledRecording service. The set of properties that are supported for an argument of type
\texttt{A\_ARG\_TYPE\_RecordScheduleParts} can be retrieved by specifying
“\texttt{A\_ARG\_TYPE\_RecordScheduleParts}” in the \texttt{DataTypeID} argument when invoking the
\texttt{GetPropertyList()} action. The support level for each of those supported member properties of each class
can be retrieved by invoking the \texttt{GetAllowedValues()} action.

The \texttt{recordSchedule} support level for the specified class indicates the use of a member property when a
control point retrieves a \texttt{recordSchedule} object. If a member property is defined as REQUIRED for
\texttt{recordSchedule} usage, an argument of type \texttt{A\_ARG\_TYPE\_RecordSchedule} MUST contain that member
property and the ScheduledRecording service MUST support it. OPTIONAL supported member properties
that are enumerated in the \texttt{Filter} argument MUST also be specified in the argument. If the resulting XML
is not a valid document, other OPTIONAL properties MUST be added to create the smallest valid XML
document. If the action does not have a \texttt{Filter} argument (like the \texttt{CreateRecordSchedule()} action),
the action MUST return all OPTIONAL supported member properties (as if the \texttt{Filter} argument were set to
“*::*”). If a control point does not specify a supported OPTIONAL member property in a request, the
ScheduledRecording service MUST add it into the response and provide its default setting. The set of
properties that are supported for an argument of type \texttt{A\_ARG\_TYPE\_RecordSchedule} can be retrieved by
specifying “\texttt{A\_ARG\_TYPE\_RecordSchedule}” in the \texttt{DataTypeID} argument when invoking the
\texttt{GetPropertyList()} action. The support level for each of those supported member properties of each class
can be retrieved by invoking the \texttt{GetAllowedValues()} action.

The \texttt{recordTask} support level for the specified class indicates the use of a member property when a
control point retrieves a \texttt{recordTask} object. If a member property is defined as REQUIRED for \texttt{recordTask}
usage, an argument of type \texttt{A\_ARG\_TYPE\_RecordTask} MUST contain that member property and the
ScheduledRecording service MUST support it. OPTIONAL supported member properties that are
enumerated in the \texttt{Filter} argument MUST also be specified in the argument. If the resulting XML is not a
valid document, other OPTIONAL properties MUST be added to create the smallest valid XML document.
The set of properties that are supported for an argument of type \texttt{A\_ARG\_TYPE\_RecordTask} can be
retrieved by specifying “\texttt{A\_ARG\_TYPE\_RecordTask}” in the \texttt{DataTypeID} argument when invoking the
\texttt{GetPropertyList()} action. The support level for each of those supported member properties of each class
can be retrieved by invoking the \texttt{GetAllowedValues()} action.

Dependent properties are PROHIBITED if their associated independent property does not exist. They can
be REQUIRED or OPTIONAL when the independent property does exist.

\section*{C.1.2 recordScheduleParts Properties}

The following table indicates the support level (\texttt{REQUIRED}, \texttt{OPTIONAL}, \texttt{PROHIBITED} or
\texttt{UNDEFINED}) of a property when used in an argument of type \texttt{A\_ARG\_TYPE\_RecordScheduleParts} for
each class. The \textbackslash \checkmark mark indicates that the property’s support level is inherited from the parent class. The
coloring still indicates the support level.

### recordSchedule Properties

The next table indicates the support level (REQUIRED, OPTIONAL, PROHIBITED or UNDEFINED) of a property when used in an argument of type `A_ARG_TYPE_RecordSchedule` for each class. The √ mark indicates that the property’s support level is inherited from the parent class. The coloring still indicates the support level.

- `taskState@lastBitsRecorded`
- `taskState@fatalError`
- `taskState@currentErrors`
- `taskState@informationList`

### C.1.4 `recordTask` Properties

The next table indicates the support level (REQUIRED, OPTIONAL, PROHIBITED or UNDEFINED) of a property when used in an argument of type `A_ARG_TYPE_RecordTask`. The √ mark indicates that the property’s support level is inherited from the parent class. The coloring still indicates the support level.

C.2 Class Definitions

The following sections define the standard record classes. The support level of the available properties for each class is also indicated. Vendors MAY add vendor-dependent properties to any of the defined classes. An instance of a normative class MUST NOT add properties, other than the properties already listed for each class definition below. In other words, a given instance of a record class can only have:

- The properties listed for that class (as per each definition below).
- The properties that are defined members of the parent class.
- Vendor-defined properties that are using other XML namespace(s).
ScheduledRecording:2

- ContentDirectory service properties imported with a normative namespace prefix (see Appendix B.17, “ContentDirectory Service Imported Properties”).

C.3 object Base Class

This is the abstract base class for the entire ScheduledRecording service class hierarchy. No object of this abstract class can be instantiated. The object class defines properties that are common to all ScheduledRecording service objects. The table below lists all standard defined properties (see Appendix B, “AV Working Committee Extended Properties” for the definition of each property) and indicates the support level (PROHIBITED, OPTIONAL, REQUIRED, and UNDEFINED) in this class for each property.

### C.3.1 `object.recordSchedule` Class

This is the abstract base class for the ScheduledRecording service record schedules class hierarchy. No object of this abstract class can be instantiated. The `object.recordSchedule` class defines properties that are common to all `object.recordSchedule` list entries. The table below lists all `recordSchedule`-related standard defined properties (`recordTask`-only properties are omitted from the table – see Appendix B, “AV Working Committee Extended Properties” for the definition of each property) and indicates the support level (PROHIBITED, OPTIONAL, REQUIRED, and UNDEFINED) in this class for `recordScheduleParts` (RSP) and `recordSchedule` (RS) usage for each property.

</table>
C.3.1.1  

**object.recordSchedule.direct** Class

The **object.recordSchedule.direct** abstract class is derived from the **object.recordSchedule** class. No object of this abstract class can be instantiated.

The main characteristic of the **object.recordSchedule.direct** class is that all the information that is needed to create associated **recordTask** instances is contained within the properties of the **recordSchedule**. The properties contain sufficient information to allow the ScheduledRecording service to translate this information into a deterministic set of **recordTask** properties. For example, if a ScheduledRecording service implementation supports the **object.recordSchedule.direct.programCode** class, the ScheduledRecording service is able to interpret the **scheduledProgramCode** property and derive the appropriate **taskStartDate**, **taskStartTime**, **taskDuration**, and **taskChannelID** **recordTask** properties from it. The table below lists all standard defined properties (see Appendix B, “AV Working Committee Extended Properties” for the definition of each property) and indicates the support level (PROHIBITED, OPTIONAL, REQUIRED, and UNDEFINED) in this class for **recordScheduleParts** (RSP) and **recordSchedule** (RS) usage for each property.

### C.3.1.1.2 \textit{object.recordSchedule.direct.cdsEPG} Class

The \textit{object.recordSchedule.direct.cdsEPG} class is used to create \textit{recordSchedule} instances for scheduling of recordings, based on local EPG information. The content to be recorded is uniquely identified by the \textit{scheduledCDSObjectID} property that MUST reference an EPG item (\textit{object.item.epgItem} class) in an associated ContentDirectory service. Most EPG item types currently defined identify only a single recording event. In the future, new EPG item types may be defined that identify multiple recording events.

The REQUIRED association between a ContentDirectory service and a ScheduledRecording service is established by having both services reside within the same UPnP MediaServer device. See also Appendix E, “ScheduledRecording Service Relationship to ContentDirectory Service” and Appendix F, “ ScheduledRecording Service Relationship to EPG” for further details.

The table below lists all standard defined properties (see Appendix B, “AV Working Committee Extended Properties” for the definition of each property) and indicates the support level (\textit{PROHIBITED}, \textit{OPTIONAL}, \textit{REQUIRED}, and \textit{UNDEFINED}) in this class for \textit{recordScheduleParts} (RSP) and \textit{recordSchedule} (RS) usage for each property.

### C.3.1.1.3 `object.recordSchedule.direct.cdsNonEPG` Class

The `object.recordSchedule.direct.cdsNonEPG` class is used to create `recordSchedule` instances for scheduling of recordings, for which (only) channel information is available in a local ContentDirectory database. The content to be recorded is uniquely identified by the `scheduledStartDateTime` and `scheduledDuration` properties, supplemented with the `scheduledCDSObjectID` property that MUST reference a ContentDirectory service object whose class is not “`object.item.epgItem`” or derived from that class. Additionally, the referenced ContentDirectory service object MUST identify content that will be available for recording at the time the recording is scheduled to start.

Examples of applicable ContentDirectory service objects are:

- A User Channel object that contains specific channel information.
- An object that represents an analog A/V input connection to the device.
- An object that represents an IP network program feed.
- An object that represents an already existing file.
- Etc.

The REQUIRED association between a ContentDirectory service and a ScheduledRecording service is established by having both services reside within the same UPnP MediaServer device. See also Appendix E, “ScheduledRecording Service Relationship to ContentDirectory Service” and Appendix F, “ScheduledRecording Service Relationship to EPG” for further details.

### C.3.1.1.4 **object.recordSchedule.direct.programCode** Class

The object.recordSchedule.direct.programCode class is used to create recordSchedule instances for scheduling of recordings, based on program code information. The content to be recorded is uniquely identified by the scheduledProgramCode property that contains a unique code that can be translated by the ScheduledRecording service into a precise start date, start time, duration and channel for the recording event(s). However, most program code types currently defined identify only a single recording event. In the future, new program code types may be defined that identify multiple recording events.
The table below lists all standard defined properties (see Appendix B, “AV Working Committee Extended Properties” for the definition of each property) and indicates the support level (PROHIBITED, OPTIONAL, REQUIRED, and UNDEFINED) in this class for recordScheduleParts (RSP) and recordSchedule (RS) usage for each property.

C.3.1.2 object.recordSchedule.query Class

The object.recordSchedule.query abstract class is derived from the recordSchedule base class. No object of this abstract class can be instantiated.

The main characteristic of the object.recordSchedule.query class is that the properties of the recordSchedule are used as matching criteria to select items from external sources (like EPG databases, side-band metadata streams in digital broadcasts, etc.). After appropriate searching and matching, the...
metadata from these external items is used to populate `recordTask` instances. This process ensures that the `recordTask` properties match the rules set forth in the `recordSchedule`’s properties (matching criteria).

The table below lists all standard defined properties (see Appendix B, “AV Working Committee Extended Properties” for the definition of each property) and indicates the support level (PROHIBITED, OPTIONAL, REQUIRED, and UNDEFINED) in this class for `recordScheduleParts` (RSP) and `recordSchedule` (RS) usage for each property.

C.3.1.2.1 `object.recordSchedule.query.contentName` Class

The `object.recordSchedule.query.contentName` class is used to create `recordSchedule` instances for scheduling of recordings, based on program or series name information. The content to be recorded is determined by matching the value, specified in the `matchingName` property to the names of content items made available to the ScheduledRecording service by REQUIRED external resources like access to EPG databases, access to Service Information side-band data in digital broadcasts, etc. The matching process

© 2013, UPnP Forum. All rights Reserved.
can be further restricted by providing a combination of Matching Qualifying Criteria properties. Any external content item MUST match those additional criteria to be considered a potential candidate for recording.

The table below lists all standard defined properties (see Appendix B, “AV Working Committee Extended Properties” for the definition of each property) and indicates the support level (PROHIBITED, OPTIONAL, REQUIRED, and UNDEFINED) in this class for recordScheduleParts (RSP) and recordSchedule (RS) usage for each property.

**C.3.1.2.2 `object.recordSchedule.query.contentID` Class**

The `object.recordSchedule.query.contentID` class is used to create `recordSchedule` instances for scheduling of recordings, based on program or series ID information. The content to be recorded is determined by matching the value, specified in the `matchingID` property to the IDs of content items made available to the ScheduledRecording service by REQUIRED external resources like access to EPG.
The matching process can be further restricted by providing a combination of Matching Qualifying Criteria properties. Any external content item MUST match those additional criteria to be considered a potential candidate for recording.

The table below lists all standard defined properties (see Appendix B, “AV Working Committee Extended Properties” for the definition of each property) and indicates the support level (PROHIBITED, OPTIONAL, REQUIRED, and UNDEFINED) in this class for both input and output for each property.

C.3.2 **object.recordTask** Class

This is the base class for the ScheduledRecording service record task class hierarchy. Currently, this is the only class defined in this hierarchy. All `recordTask` objects in the ScheduledRecording service are members of this class. The `object.recordTask` class defines properties that are common to all `recordTask` list entries.

A `recordTask` object represents an actual recording occurrence. More sophisticated ScheduledRecording service implementations MAY implement OPTIONAL actions that allow a control point to manipulate individual `recordTask` instances. For example, the OPTIONAL `DisableRecordTask()` action can be used to selectively disable (that is: recording task suspended and any actual recording MUST NOT occur) one or more `recordTask` instances, spawned from the same `recordSchedule` if not all recordings are desired.

A `recordTask` SHOULD be created by the ScheduledRecording service as soon as all necessary information (like EPG data) becomes available. It SHOULD be maintained at least until the `recordTask` has finished. It is RECOMMENDED to maintain all completed `recordTask` instances for a reasonable time or until space is needed so that control points can retrieve `recordTask` state information after the recording has finished.

One or more `recordTask` instances can be created per `recordSchedule`. Some `recordSchedule` instances may not have a `recordTask` because they have not scheduled any recordings yet.

The list of the `recordTask` instances can be obtained using the `BrowseRecordTasks()` action. A `recordTask` can be disabled using the `DisableRecordTask()` action.

Note that a `recordTask` is not created by a control point directly; therefore, the input support level below indicates PROHIBITED for all properties.

The table below lists all `recordTask`-related standard defined properties (`recordSchedule`-only properties are omitted from the table – see Appendix B, “AV Working Committee Extended Properties” for the definition of each property) and indicates the support level (PROHIBITED, OPTIONAL, and REQUIRED) in this class for `recordTask` (RT) usage for each property.

Appendix D.  EBNF Syntax Definitions (Normative)

The following sections define the syntax used for some of the properties and classes described in the previous sections. The syntax is formally defined using EBNF as described in Section 1.2.3, “Extended Backus-Naur Form”.

D.1  Priority Syntax

Note: Due to possible future extensions, unknown value inputs MUST be gracefully ignored. In this case, the semantics of the “DEFAULT” value MUST be applied.

```
priority-value ::=  standard-value
                    extended-value (* extended-value is only applicable if priority@orderedValue is supported *)

standard-value ::=  level|'DEFAULT'
level ::= ('L' number)
number ::= (* integer (n>0) *)
extended-value ::= 'HIGHEST'|'LOWEST'|level-hi|level-low|object-id
level-hi ::=  level '_HI'
level-low ::=  level '_LOW'
object-id ::= (* @id value *)
```

D.2  Date&time Syntax

```
sched-start ::=  date-time | day-of-yr-time | named-day-time | T-labeled-time | 'NOW'
start-range ::=  (date-time|'PAST'|'NOW') '/' (date-time|'INFINITY')
date-time-range ::=  date-time '/' date-time
duration ::=  'P' [n 'D'] time
duration-long ::=  duration|'INFINITY'
duration-any ::=  duration|'INFINITY'|'ANY'
duration-adj ::=  ('+'|'-'') duration
duration-range ::=  duration '/' duration-long
date-time ::=  yyyy '-' mm '-' dd T-labeled-time
day-of-yr-time ::=  mm '-' dd T-labeled-time
named-day-time ::=  named-day T-labeled-time

T-labeled-time ::=  'T' time [zone]
time ::=  HH ':' MM ':' SS
zone ::=  'Z'|(('+'|'-') HH ':' MM)
month-day ::=  mm '-' dd
named-day ::=  'MON'|'TUE'|'WED'|'THU'|'FRI'|'SAT'|'SUN'| 'MON-FRI'|'MON-SAT'
n ::=  1*DIGIT (* non-negative integer *)
yyyy ::=  4DIGIT (* 0001-9999 *)
mm ::=  2DIGIT (* 01-12 *)
```
dd ::= 2DIGIT (* 01-28, 01-29, 01-30, 01-31 based on month/year *)
HH ::= 2DIGIT (* 00-23 *)
MM ::= 2DIGIT (* 00-59 *)
SS ::= 2DIGIT (* 00-59 *)

### D.3 Class Name Syntax

className ::= 'OBJECT.' (sName|tName)
sName ::= 'RECORDSCHEDULE.' (dName|qName)
tName ::= 'RECORDTASK' ('.'. shortName)*
dName ::= 'DIRECT.' directName ('.'. shortName)*
qName ::= 'QUERY.' queryName ('.'. shortName)*
directName ::= 'MANUAL'|'CDSEPG'|'CDSNONEPG'|'PROGRAMCODE'
queryName ::= 'CONTENTNAME'|'CONTENTID'
shortName ::= (* valid XML 1.0 name, excluding the characters '.'(UTF-8 code 0x2E)
and
':'(UTF-8 code 0x3A) *)
Appendix E. ScheduledRecording Service Relationship to ContentDirectory Service (Informative)

As noted in the specification, the only formal relationship between a ScheduledRecording service and a ContentDirectory service is through the `object.recordSchedule.direct.cdsEPG` and `object.recordSchedule.direct.cdsNonEPG` classes. The reason for keeping the ScheduledRecording service and ContentDirectory service as separate services is because they serve different purposes. The ScheduledRecording service is a service for creating a schedule of recording operations whereas the ContentDirectory service is a service for exposing content and its metadata. Therefore, the only formal dependency on a ContentDirectory service is to accommodate the case where a control point identifies recordable content on a ContentDirectory service and then instructs a sibling ScheduledRecording service to record that content.

Although a ScheduledRecording service and a ContentDirectory service are generally separated at the protocol layer, the two services can often interact in an out-of-band manner to realize some additional usages.

Showing Recorded Content in a ContentDirectory service: Vendors who are interested in making recorded content discoverable and network-consumable can expose the recorded content through the associated ContentDirectory service. The exact location where the recorded content will be exposed is determined by the implementation and is vendor-dependent.

Sending recorded bits to a ContentDirectory service: One methodology for sending recorded content to a ContentDirectory service (that is completely separate from the ScheduledRecording service) is to do the following: Start the process by having the control point invoke the `ContentDirectory::CreateObject()` action and obtain a `res@importUri` where binary data can be deposited via HTTP-POST. As a second step, the control point uses the `CreateRecordSchedule()` action with the appropriate destination type (`recordDestination = “MyNAS”, recordDestination@mediaType = “HDD”, recordDestination@targetURL = res@importUri`) to accommodate a URI that accepts HTTP-POST transmissions. When the ScheduledRecording service begins to record (or finishes recording) the ScheduledRecording service implementation can transmit the recorded bits using an HTTP-POST transaction. When the transmission is complete, the ContentDirectory service updates its metadata to allow rendering endpoints to play the content.

Scheduled recording from an external location: Vendors who want to use an external location as a source of recordable content can achieve this use case in the following manner. The control point obtains a URI that represents content that can be recorded. The control point creates a manual `recordSchedule` with the appropriate scheduling information and the URI as the input source in the `scheduledChannelID` property. At the instructed time, the ScheduledRecording service will download or stream the content data bytes from the URI to complete the recording.
Appendix F. ScheduledRecording Service Relationship to EPG (Informative)

ScheduledRecording service implementations are NOT REQUIRED to be tied to an Electronic Program Guide (EPG), as demonstrated by the `object.recordSchedule.direct.manual` class. However the subject of EPG data is an important discussion point for achieving a variety of use cases. This appendix does not exhaustively cover every relationship between a ScheduledRecording service and EPG, but it does discuss how the out-of-band EPG can fit into various use cases.

For scenarios where a control point creates a manual `recordSchedule`, the EPG directly provides information to the user. In some setups, the user may have to read an EPG in order to manually provide the control point with the scheduling and tuning input values. In other setups, the control point may have access to EPG data, allowing the control point to provide a user interface that is focused on the EPG, hiding the control point input values from the user. By design, the `object.recordSchedule.direct.manual` class does not require an EPG on the ScheduledRecording service because the ScheduledRecording service can resolve a manual recording type to discrete `recordTask` instances, without any additional information.

For scenarios where the control point creates a `object.recordSchedule.direct cdsEPG` or `object.recordSchedule.query.contentName/contentID` class `recordSchedule`, the user still interacts with the EPG in some way. In some setups, the user will need to obtain a well-defined value (program or series ID, program title, etc.) from the EPG. In setups where the control point has access to EPG data, the user may not need to know about those well-defined values. Regardless of how the control point acquires the well-defined values, the ScheduledRecording service still needs to be able to translate this higher-level information into a `recordSchedule` object. In some setups, the ScheduledRecording service will have access to a complete EPG to assist with the creation of individual `recordSchedule` instances. In other setups, the ScheduledRecording service may have access to limited scheduling information on a broadcast stream that allows the ScheduledRecording service to know when to perform a recording operation. Intentionally, these types of recording types are designed around a particular EPG or broadcast system.

For scenarios where the control point creates a `object.recordSchedule.query.contentName` class of `recordSchedule`, the ScheduledRecording service will likely have direct access to EPG data. The reason is that this type of `recordSchedule` allows the control point to specify values that are not well-defined but still convey the desired content for recording. Therefore, the ScheduledRecording service generally needs to have additional intelligence to translate the `recordSchedule` into discrete `recordTask` instances. Often this process will include continually cross-referencing the `recordSchedule` properties with information in an EPG, and generating a `recordTask` instance every time a match is found between the matching criteria of the `recordSchedule` and an EPG item.

For scenarios where the control point creates a `object.recordSchedule.direct cdsEPG` class of `recordSchedule`, the ScheduledRecording service and its sibling ContentDirectory service will likely have access to some kind of EPG data. The ContentDirectory service uses the EPG to expose recordable content to the control point/user. The user chooses a recordable object and then instructs the ScheduledRecording service to record using the `didl-lite:@id` value of the recordable object. Although it is generally useful for a ContentDirectory service to expose as much scheduling metadata as possible, the EPG data that is exposed by the ContentDirectory service is determined by the ContentDirectory/ScheduledRecording service implementer. As such, the only thing that a user needs is a control point that is capable of representing the recordable objects found in the ContentDirectory service.
Appendix G. AVDT Examples (Informative)

The following sections contain full-fledged examples of AVDT XML Document instances that a particular implementation might return in response to the invocation of the GetAllowedValues() action. All AV Working Committee defined values are printed using the forum character style. All device dependent values are printed using the vendor character style.

Note: These examples may be used as a starting point for real life implementations. Vendors may delete OPTIONAL property definitions that they do not support and add, delete and/or modify device dependent values to match their implementation.

G.1 A_ARG_TYPE_RecordSchedule AVDT Example

Note: This A_ARG_TYPE_RecordSchedule example is marked by a grey background.

Request:
GetAllowedValues("A_ARG_TYPE_RecordSchedule", "*: *")

The following response will be generated:
