List of Tables

Table 1: Device Requirements ................................................................................................................. 5
1. Overview and Scope

This device template is compliant with the UPnP™ Architecture, Version 1.0.

**WANConnectionDevice** is a REQUIRED virtual device defined under
urn:schemas-upnp-org:device:WANDevice

An instance of **WANDevice** is specified under the root device
urn:schemas-upnp-org:device:InternetGatewayDevice

**WANConnectionDevice** is a container for a link and connection services specific to a link on a WAN interface. Most types of WAN interfaces can be modeled by a single instance of **WANConnectionDevice**. However, in the case of DSL, each VC can have unique link attributes and can be provisioned for connection services that are different from other VCs. In this case, each VC will be modeled by an instance of **WANConnectionDevice**. Also, in the case of a POTS modem based InternetGatewayDevice (IGD), each separate ISP instance can be modeled as an instance of **WANConnectionDevice**.

The *Theory of Operation* section describes the services contained in **WANConnectionDevice** in more detail.

**Figure 1: **WANConnectionDevice** Devices and Services Hierarchy

1.1. Change Log

Changes from **WANConnectionDevice:0.1**

Added text to Theory of Operation section.

Changes from WANConnectionDevice: 0.2
- Text changes per discussions at 12/1/00 F2F meeting
- Updated document status to template design complete

Changes from WANConnectionDevice: 0.21
- Updated to device template v1.01
- Verified against TDC checklist v1.01
- Removed reference to Dialup_AOL
- Changed EthernetLinkConfig, POTSLinkConfig and CableLinkConfig services from Required to Optional

Changes from WANConnectionDevice: 0.8
- Added XML comment tags to comments text in XML template

Changes from WANConnectionDevice: 0.81
- Changed version numbers for contained devices and services
- Changed definition of ServiceIDs for contained services

Changes from WANConnectionDevice: 0.9
- Changed WANDSLLinkConfig from required to optional in device requirements (Table 1) – due to lack of sufficient number of sample implementations.

Changes from WANConnectionDevice: 0.99
- Version updated to reflect 45-day review completion. No other changes to this draft.

Changes from WANConnectionDevice: 0.991
- Copyright messages and document status updated.
2. Device Definitions

2.1. Device Type

The following device type identifies a device that is compliant with this template:

```
urn:schemas-upnp-org:device:WANConnectionDevice:1
```

2.2. Device Model

Products that expose devices of the type `urn:schemas-upnp-org:device:WANConnectionDevice:1` must implement minimum version numbers of all required embedded devices and services specified in the table below.

**Table 1: Device Requirements**

<table>
<thead>
<tr>
<th>Device Type</th>

</tr>
</tbody>
</table>
2.2.1. Description of Device Requirements

Each **WANConnectionDevice** models a link on a physical WAN interface. A **WANDevice** may contain one or more instances of **WANConnectionDevice** corresponding to one or more active links on a modem. **WANCommonInterfaceConfig** is a service in **WANDevice** that models attributes and actions that are common across all links and all connection instances on a link.

2.2.2. Relationships Between Services

The **DefaultConnectionService** state variable in the **Layer3Forwarding** service refers to the UDN of a **WANConnectionDevice** instance – this is an external dependency. There may also be dependencies between a specific instance of **WAN*LinkConfig** and **WAN***Connection** service in a **WANConnectionDevice**.
2.3. Theory of Operation

Connections to the Internet are initiated either from the WAN interface of an IGD or are relayed or bridged through the WAN interface. DSL can be provisioned to support multiple Virtual Circuits (VCs) simultaneously. Each VC can in turn be provisioned to support one or more PPP connections or an IP connection. To handle these scenarios, each WANDevice includes one or more instances of WANConnectionDevice. A WANConnectionDevice encapsulates a logical or physical link on a WAN interface over which connections are modeled. Furthermore, connections on a WAN interface can be of type PPP or IP. These are modeled by corresponding WAN[PPP/IP]Connection service instances. Properties specific to a link are modeled in a WAN[POTS/DSL/Cable/Ethernet]LinkConfig service.

In accordance with UPnP Architecture version 1.0, the maximum number of WANConnectionDevice instances is static and specified in the InternetGatewayDevice description document. Similarly, the number of WAN[PPP/IP]Connection service instances contained in each WANConnectionDevice is also pre-specified.

The definition of the WAN*LinkConfig1 and WAN*Connection2 services is based on the following broad objectives:

- To allow for the distinction between Internet access scenarios that are typically independent of the modem types used and configuration scenarios that are specific to modem types. This enables easier modeling of various connectivity scenarios independent of the underlying modem type or its configuration.
- To support most of the commonly deployed connection types (either originating at the WAN interface of the gateway or relayed/bridged through the gateway)
- To support manual (may need Out-Of-Band security and access control mechanisms) or automatic configuration of parameters on a modem
- To ensure extensibility for new connection types in future.

Configuration and connectivity scenarios are independent of each other. However, there is an implied relationship in that control points will first need to complete configuration actions (unless this process is completed automatically) before initiating any connectivity related actions. It is also important to note that auto and manual configuration of a modem are mutually exclusive operations in most cases. Furthermore, in most deployment scenarios, auto configuration is given higher priority over manual configuration.

The process of configuration and subsequent management of WAN connections is via 3 variables:

- **LinkType**: This variable, if defined in a WAN*LinkConfig service, indicates the protocol configured on a specific link. This variable can be set manually, or through an automatic mechanism (for example, AutoConfig specified by DSLForum)
- **PossibleConnectionTypes**: specifies only those connection types that are permissible in a particular implementation for a specific modem link configuration (as indicated by the value of LinkType). This variable is defined in WAN*Connection service.
- **ConnectionType**: indicates a specific connection type selected from those permissible on a link, as indicated by PossibleConnectionTypes. This variable is defined in WAN*Connection service.

Figure 2 illustrates the process of configuration and connection management, using a DSL modem as an example. Note that the configuring agent and subsequent user(s) of connections need not be the same network entities. The 4 conceptual steps are described below.

---

1 Refer to companion DCP drafts for specific WAN*LinkConfig descriptions and description of variables such as LinkType.

2 Refer to companion DCP drafts for specific WAN*Connection service descriptions and variables such as PossibleConnectionTypes and ConnectionType.

3 Refer to the DSL Forum website (www.dslforum.org) for more details.
- **Step 1**: A configuring entity sets up the LinkType to an appropriate value.
- **Step 2**: The value of LinkType is combined with the capabilities of the modem to come up with a list of possible connection types appropriate for the particular configuration.
- **Step 3**: The variable PossibleConnectionTypes is updated with the list derived from step above.
- **Step 4**: A control point may subsequently initiate a connection by setting ConnectionType to a value from the allowable list specified in PossibleConnectionTypes. In this step, a control point evaluates its own capabilities vis-à-vis the capabilities exposed in PossibleConnectionTypes and selects one that is appropriate for its use. In some deployment scenarios, the value of ConnectionType may be strictly read-only from a control point perspective.

![Figure 2: Configuration and Connection Management](image)

The following table lists valid combinations of LinkType and PossibleConnectionTypes as well as connection service type for different types of WAN interfaces.

<table>
<thead>
<tr>

*NOTE TO IMPLEMENTERS:* PPP-based connected types, originating from the WAN interface of an IGD, are possible for an Ethernet-attached external modem, most likely over an Ethernet or IP link. For example, a PPPoE connection can originate on the WAN interface of the IGD, terminating at the ISP head-end, with the externally attached modem acting as a pass-through Ethernet bridge. However, modeling this (or other similar) connection type(s) may require additional variables and/or actions in the WANPPPPConnection service not currently defined by the IGD working committee. If needed, these features should be implemented as vendor extensions.
3. XML Device Description

3. Test

No semantic tests are defined for this device.
Change History

Change Log for Version 1.0 (10-4-00)

- Revised the Title Page to call out V1.0 of the Device Template
- Changed to be consistent with Sample Designs released to the Technical Committee
- Deleted the DeviceList from the title page.
- Updated Table 1 to shade boxes that do not require entry.
