1. Overview and Scope

This device template is compliant with the Universal Plug and Play Architecture, Version *1.0* and *1.1*.

WANDevice is a REQUIRED virtual device under the root device:

urn:schemas-upnp-org:device:*InternetGatewayDevice:2*

WANDevice is a standalone virtual device and may be included in other root devices if appropriate.

Figure 1 below illustrates a generic Internet Gateway Device (IGD) consisting of one or more physical WAN and LAN interfaces. The IGD MUST support one WAN interface, but MAY support more than one physical WAN interface to connect to the Internet. An implementation MAY host the WAN interface and LAN interface (mentioned above) on the same physical network interface card. Some examples of technologies that provide WAN connectivity to the Internet include DSL, cable and POTS.

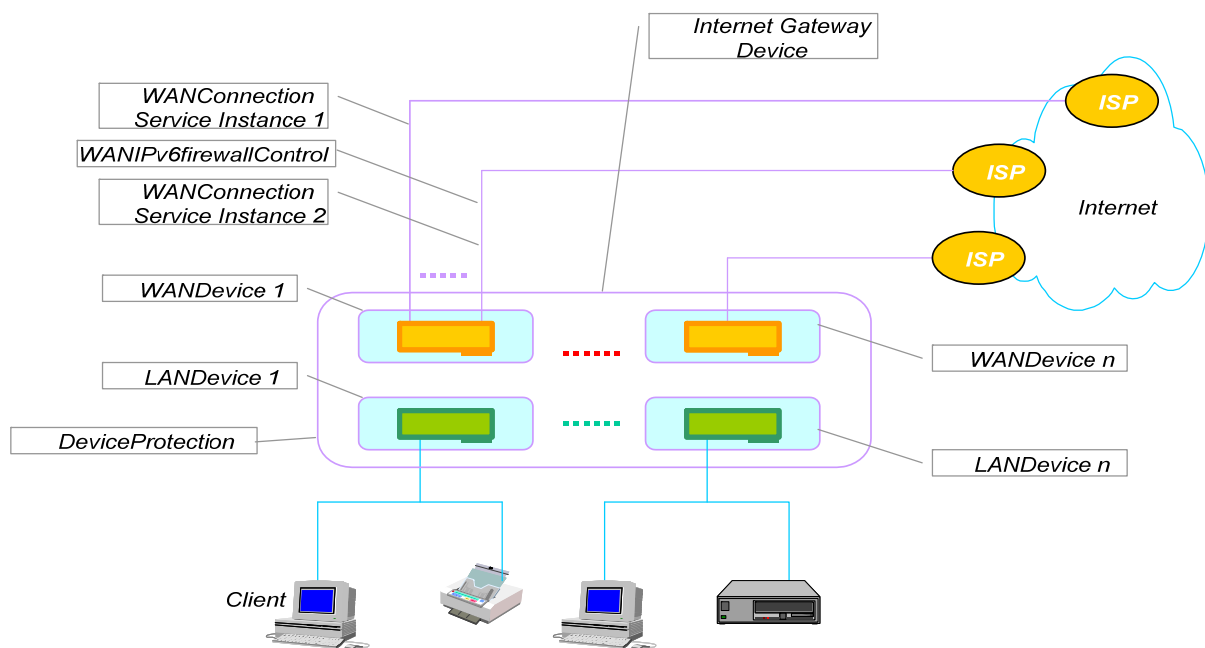

Figure 1: *InternetGatewayDevice* with WAN Interfaces

Each WAN interface MUST support one Internet connection, but MAY simultaneously support more than one Internet connection. The modeling of connections is described in the *Theory of Operation* section.

Each *WANDevice* is a virtual instantiation of a physical WAN interface on the Internet gateway. If an *InternetGatewayDevice* provides multiple WAN physical interfaces to UPnP clients, each of these will typically be included in the device description document as distinct *WANDevice* instances. However, an implementation may choose to encapsulate more than one physical WAN interface in a single *WANDevice*. This may be done, for example, in applications that use asymmetric connections like a satellite downlink and POTS uplink. Another example would be where multiple physical WAN interfaces are pooled and presented as one device. Aspects such as load balancing between the pooled resources would be transparent to UPnP clients in this case.

Figure 2 conceptually illustrates the hierarchy of devices and services in *WANDevice*. Each *WANDevice* has one or more instances of *WANConnectionDevice*. It also has a *WANCommonInterfaceConfig* service that models attributes and actions of the WAN interface, common across all connection service instances. The *Theory of Operation* section describes the devices and services contained in *WANDevice* in more detail.
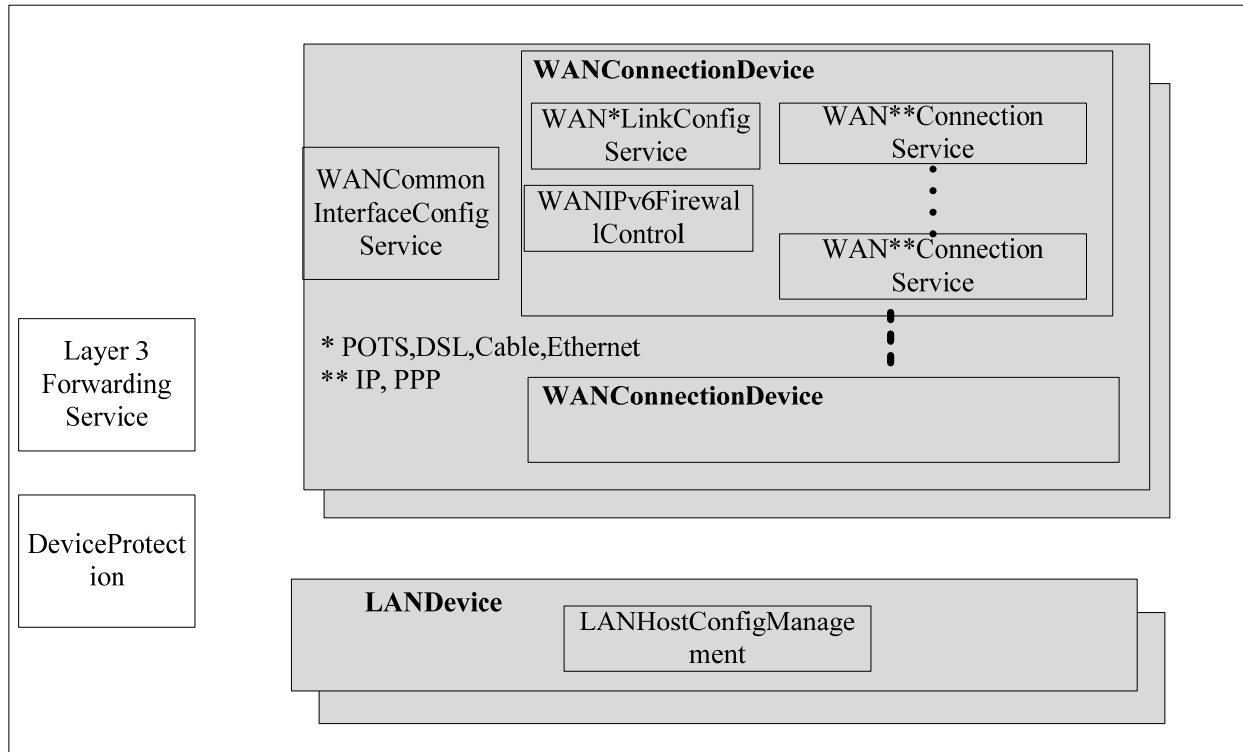

Figure 2: *WANDevice* Devices and Services Hierarchy

2.   Device Definitions

2.1.   Device Type

The following device type identifies a device that is compliant with this template:

urn:**schemas-upnp-org:device**:*WANDevice:2*

2.2.   Device Model

Products that expose devices of the type urn:**schemas-upnp-org**:**device**:*WANDevice:2* MUST implement minimum version numbers of all required embedded devices and services specified in the table below.

Table 1: Device Requirements

DeviceType	Root	Req. or Opt.[1]	ServiceType	Req. or Opt.[1]	Service ID[2]
WANDevice:2		*R*	*WANCommonInterfaceConfig:1*	*R*	*WANCommonIFC1*
			Non-standard services embedded by an UPnP vendor go here.	*X*	*TBD*
WANConnectionDevice:2 (an instance of WANDevice may include one or more WANConnectionDevice instances)		*R*	*WANPOTSLinkConfig:1*	*O for POTS modems*	*WANPOTSLinkC1*
			WANDSLLinkConfig:1	*O for DSL modems*	*WANDSLLinkC1*
			WANCableLinkConfig:1	*O for Cable modems*	*WANCableLinkC1*
			WANEthernetLinkConfig:1	*O for Ethernet attached modems*	*WANEthLinkC1*
			WANPPPConnection:1	*R for modems that support PPP based connections*	*Multiple instances possible within a WANConnectionDevice. ServiceIDs for multiple instances will be WANPPPConn1, WANPPPConn2, WANPPPConn3 and so on.*
			WANIPConnection:2	*R for modems that support IPv4 based*	*Only 1 instance per WANConnectionDevice is envisioned at*

				connections	*this time, although the design could support multiple instances in future. ServiceIDs for multiple instances will be WANIPConn1, WANIPConn2, WANIPConn3 and so on.*
			WANIPv6FirewallControl:1	*O for IPv6 enabled IGDs*	*Only 1 instance per WANIPv6FirewallControl is envisioned at this time, although the design could support multiple instances in future. ServiceIDs for multiple instances will be WANIPv6Firewall1, WANIPv6Firewall2, WANIPv6Firewall3 and so on.*
			Non-standard services embedded by an UPnP vendor go here.	*X*	*TBD*
LANDevice:1		*O*	*LANHostConfigManagement:1*	*O*	*LANHostCfg1*
Non-standard devices embedded by an UPnP vendor go here.	*TBD*	*X*	*TBD*	*TBD*	*TBD*

[1] R = Required, O = Optional, X = Non-standard.
[2] Prefixed by urn:**upnp-org**:**serviceId**: .

2.2.1. Description of Device Requirements

Each *WANDevice* models a physical WAN interface. A *WANDevice* may contain one or more instances of *WANConnectionDevice* corresponding to one or more active links on the *WANDevice*. *WANCommonInterfaceConfig* is a service in *WANDevice* that models attributes and actions common across all links and all connection instances on a link.

2.2.2. Relationships Between Services

WANCommonInterfaceConfig defines variables and actions common across all instances of *WAN{PPP/IP}Connection*s and *WANIPv6FirewallControl*s in a *WANDevice*. There may also be dependencies between a specific instance of *WAN**LinkConfig (where * can be POTS, DSL, Cable or Ethernet) and *WAN***Connection service (where ** can be PPP or IP) or *WANIPv6FirewallControl* service in a *WANConnectionDevice*.

2.3. Theory of Operation

As described earlier, *WANDevice* models a physical WAN interface. Connections to the Internet are initiated either from the WAN interface or are relayed or bridged through the WAN interface. For example,

- DSL can be provisioned to support multiple Virtual Circuits (VCs) simultaneously. Each VC can in turn be provisioned to support one or more PPP connections or an IP connection.
- Connections to multiple ISPs can be provisioned / configured on a POTS modem.

To handle these scenarios, each *WANDevice* includes one or more instances of *WANConnectionDevice*. A *WANConnectionDevice* encapsulates a logical or physical link on a WAN interface over which connections are modeled. Furthermore, connections on a WAN interface can be of type PPP or IP. These are modeled by corresponding *WAN{PPP/IP}Connection* service instances for IPv4 connections or *WANIPv6FirewallControl* service instances for IPv6 connections. Properties specific to a link are modeled in a *WAN{POTS/DSL/Cable/Ethernet}LinkConfig* service.

Some examples best illustrate this hierarchy:

- A cable modem and IP router-integrated gateway supports one always-on IP connection. This can be modeled by a *WANConnectionDevice* that includes a *WANCableLinkConfig* service and one instance of *WANIPConnection* service.
- A POTS modem needs to be setup for 2 ISPs, each with a list of phone numbers and a set of user accounts each. This is modeled by 2 *WANConnectionDevice* instances, one for each ISP. In each *WANConnectionDevice*, the *WANPOTSLinkConfig* service specifies the list of ISP phone numbers. Each individual user account is modeled by an instance of *WANPPPConnection* service in the *WANConnectionDevice*.
- A DSL modem has been provisioned with 2 PVCs. Each VC is auto-configured for classical IP over ATM. This is modeled by 2 *WANConnectionDevice* instances, one for each VC. Each *WANConnectionDevice* contains a *WANDSLLinkConfig* service instance and one instance of *WANIPConnection*.
- An Internet gateway supports an external Ethernet-attached modem (cable or DSL). This can be modeled by a *WANConnectionDevice* instance that includes a *WANEthernetLinkConfig* service and one instance of *WANIPConnection* service.

3.   XML Device Description

```xml
<?xml version="1.0"?>
