TelephonyServer:1 Device

For UPnP Version 1.0
Status: Standardized DCP (SDCP)
Date: March 22, 2011
Document Version: 1.0
Service Template Version: 2.00

This Standardized DCP has been adopted as a Standardized DCP by the Steering Committee of the UPnP Forum, pursuant to Section 2.1(c)(ii) of the UPnP Forum Membership Agreement. UPnP Forum Members have rights and licenses defined by Section 3 of the UPnP Forum Membership Agreement to use and reproduce the Standardized DCP in UPnP Compliant Devices. All such use is subject to all of the provisions of the UPnP Forum Membership Agreement.

THE UPNP FORUM TAKES NO POSITION AS TO WHETHER ANY INTELLECTUAL PROPERTY RIGHTS EXIST IN THE STANDARDIZED DCPS. THE STANDARDIZED DCPS ARE PROVIDED "AS IS" AND "WITH ALL FAULTS". THE UPNP FORUM MAKES NO WARRANTIES, EXPRESS, IMPLIED, STATUTORY, OR OTHERWISE WITH RESPECT TO THE STANDARDIZED DCPS, INCLUDING BUT NOT LIMITED TO ALL IMPLIED WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT AND FITNESS FOR A PARTICULAR PURPOSE, OF REASONABLE CARE OR WORKMANLIKE EFFORT, OR RESULTS OR OF LACK OF NEGLIGENCE.

1 Overview and Scope
This device definition is compliant with the UPnP Device Architecture version 1.0. It defines a device type referred to herein as TelephonyServer:1 device.

1.1 Introduction
The TelephonyServer device is a UPnP device that allows control points to exploit a set of telephony features such as managing telephony calls, messaging, presence etc via UPnP though other UPnP enabled home network devices. This device provides control points with the following functionality:

- Managing telephony calls including initiation of a call, rejection of a call, acceptance and modifications of a call
- Messaging features including sending and retrieving messages and notifications of incoming messages
- Enabling user friendly input capability
- Configuring of the Telephony Server via phone data model

1.2 Notation

- In this document, features are described as Required, Recommended, or Optional as follows:

  The key words “MUST,” “MUST NOT,” “REQUIRED,” “SHALL,” “SHALL NOT,” “SHOULD,” “SHOULD NOT,” “RECOMMENDED,” “MAY,” and “OPTIONAL” in this specification are to be interpreted as described in [RFC 2119].

  In addition, the following keywords are used in this specification:

  PROHIBITED – The definition or behavior is an absolute prohibition of this specification. Opposite of REQUIRED.

  CONDITIONALLY REQUIRED – The definition or behavior depends on a condition. If the specified condition is met, then the definition or behavior is REQUIRED, otherwise it is PROHIBITED.

  CONDITIONALLY OPTIONAL – The definition or behavior depends on a condition. If the specified condition is met, then the definition or behavior is OPTIONAL, otherwise it is PROHIBITED.

  These keywords are thus capitalized when used to unambiguously specify requirements over protocol and application features and behavior that affect the interoperability and security of implementations. When these words are not capitalized, they are meant in their natural-language sense.

- Strings that are to be taken literally are enclosed in “double quotes”.
- Placeholder values that need to be replaced are enclosed in the curly brackets “{” and “}”.
- Words that are emphasized are printed in italic.
- Keywords that are defined by the UPnP Working Committee are printed using the forum character style.
- Keywords that are defined by the UPnP Device Architecture are printed using the arch character style.
• A double colon delimiter, “::”, signifies a hierarchical parent-child (parent::child) relationship between the two objects separated by the double colon. This delimiter is used in multiple contexts, for example: Service::Action(), Action()::Argument, parentProperty::childProperty.

1.3 Vendor-defined Extensions
Whenever vendors create additional vendor-defined state variables, actions or properties, their assigned names and XML representation MUST follow the naming conventions and XML rules as specified in [DEVICE], Section 2.5, “Description: Non-standard vendor extensions”.

1.4 References

1.4.1 Normative References
This section lists the normative references used in this specification and includes the tag inside square brackets that is used for each such reference:

Available at: http://www.faqs.org/rfcs/rfc2119.html.

Available at: http://www.w3.org/TR/2004/REC-xml-20040204/.

1.4.2 Informative References
This section lists the informative references that are provided as information in helping understand this specification:

2 Device Definitions

2.1 Device Type
The following service type identifies a device that is compliant with this specification:

\[\text{urn:schemas-upnp-org:device:TelephonyServer:1}\]

*TelephonyServer* device is used herein to refer to this device type.

2.2 Terms and Abbreviations

2.2.1 Abbreviations

2.2.2 Terms

2.2.2.1 Telephony Server
The term Telephony Server (TS) refers to a logical device that provides common telephony features (e.g. call/video call, messaging, address book) via UPnP to other devices in the home network. A TS is usually connected to a telephony service on its WAN interface, either wire line or mobile. For example, a TS may be a mobile phone or a home gateway with VoIP features.

2.2.2.2 Telephony Client
The term Telephony Client (TC) is a networked logical device that allows the user to enjoy the telephony features provided by the Telephony Server via UPnP. A TC may usually provide input/output features for voice and video. An example of a TC is a networked TV Set.

2.2.2.3 Telephony Control Point
The term Telephony Control Point (TelCP) refers to a software feature able to control the functionalities of both TS and TC. It may be embedded in a TS, a TC or also being a physical device on its own.

2.2.2.4 InputConfig Service
The term InputConfig Service (InputConfig) refers to a software feature that is able to provide user-friendly input capability via UPnP means and expose interfaces to describe capabilities of sender/receiver of devices to be used for input services and setup the input session between the devices using the matching profile (capability) from the ICP.

Copyright © 2011 UPnP Forum. All rights Reserved.
2.2.2.5 InputConfig Control point

The Term InputConfig Control Point (ICP) refers to a software feature that is able to control the functionalities of UPnP devices to be used to provide user-friendly input features. The control here refers to getting capabilities of UPnP devices to be used for input, matching capabilities and selecting the appropriate device role such as receiving side or sending side etc.

2.3 TelephonyServer Device Architecture

This device is hosted by the Telephony Server and is active on the LAN network interface. The device embeds a number of telephony services including Call Management, Messaging, Presence, Input, Security, Configuration etc. The details for each of these services can be found in the Telephony Architecture document.

![Telephony Server Device Diagram]

Figure 2-1: TelephonyServer Device Architecture.

2.4 Device Model

TelephonyServer products MUST implement minimum version numbers of all REQUIRED embedded devices and services specified in the table below. A TelephonyServer device can be either a Root device or can be Embedded in another UPnP device (TelephonyServer or other). A TelephonyServer device (Root or Embedded) can in turn contain other standard or non-standard Embedded UPnP devices.

</thead>
</table>

¹ R = REQUIRED, O = OPTIONAL, X = Non-standard.

² R = REQUIRED, O = OPTIONAL, X = Non-standard.

³ Prefixed by urn:upnp-org:serviceId:

⁴ It MUST be noted that even though all the services for TelephonyServer:1 device have been listed as “O” in the table above, in order to be recognized as a Telephony Server, an implementation MUST have at least either of the Messaging:1 service or CallManagement:1 implemented.

### 2.4.1 Telephony Server Identity Requirements

The identity of a Telephony Server (TS) device is expressed using the standard URI (Unified Resource Identifier) scheme as specified in [RFC 2396]. In case of SIP, the identity of the Telephony Server identity contains the SIP URI. In case of a generic resource identified by a telephone number, the Telephony Server identity contains the TEL URI [RFC 3966]. The identity of a Telephony Server can be retrieved by invoking the `GetTelephonyIdentity()` action either on the CallManagement:1 service or on the Messaging:1 service.

### 2.5 Theory of Operation

A Telephony Server (TS) can provide a number of features including Call Management Service (CaMS), Messaging and presence service, inputConfig service, configuration management service etc. The Call Management Service (CaMS) is a mandatory feature for the Telephony Server (TS) and it provides the basic telephony feature such as initiation of a call, management of a call etc.

The interactions of a Telephony Server (TS) with a Telephony Control Point (TelCP) to provide basic telephony features in shown in Figure 2. The Telephony Control Point (TelCP) invokes action on the Telephony Server (TS) to initiate a call, accept or connect an incoming call or receive notifications for incoming calls and manage media session associated with the call including starting and stopping the media session. The interactions between a Telephony Control Point (TelCP) and the Messaging Service requires a number of UPnP actions to realize the features of sending and receiving messages and notifications for incoming messages.
The basic architecture for Presence service requires basic UPnP eventing mechanism for notifications of presence information. The interactions between Telephony Control Point (TelCP) and the Presence service also requires a number of UPnP actions to manipulate local presence information and to retrieve other contacts presence. The CMS service in the TS allows the manipulation of configuration parameters, both for retrieving configuration and status information from a managed device (here the TS device) or for changing its configuration; notifications of configuration updates are also available.
